## General Information

It is the responsibility of the installer to ensure that the equipment or system into which the product is incorporated complies with all relevant legislation and codes of practice which apply in the country of use.

## CE Marking

All Invertek Drives products intended for use within the European Union carry the CE mark to indicate compliance with European Directives. A declaration of conformity is available from the website, [www.invertekdrives.com](http://www.invertekdrives.com)

For compliance with the European EMC Directive, the necessary guidance is provided within this document and it is the responsibility of the installer to ensure this guidance is followed to ensure compliance.

## UL Conformity

A list of currently listed products is available from the UL website, [www.ul.com](http://www.ul.com).

For compliance with UL requirements, the necessary guidance is provided within this document and it is the responsibility of the installer to ensure this guidance is followed to ensure compliance.

## Safe Torque OFF ("STO") Function

Optidrive Eco incorporates a hardware STO (Safe Torque Off) Function, designed in accordance with the standards listed below.

Standard	Classification	Independent Approval
EN 61800-5-2:2016	Type 2	*TUV
EN ISO 13849-1:2015	PL "d"	
EN 61508 (Part 1 to 7):2010	SIL 2	
EN60204-1:2006 + A1:2009 + AC: 2010	Uncontrolled Stop "Category 0"	
EN 62061:2005/A2:2015	SIL CL 2	

\*NOTE TUV Approval of the "STO" function is relevant for drives which have a TUV logo applied on the drive rating label. The STO input must not be used for any safety related function if the drive unit does not carry the TUV logo on the rating label.

**2 Year Warranty:** All Invertek Optidrive Eco units carry a 2 year warranty against manufacturing defects from the date of manufacture. The manufacturer accepts no liability for any damage caused during or resulting from transport, receipt of delivery, installation or commissioning. The manufacturer also accepts no liability for damage or consequences resulting from inappropriate, negligent or incorrect installation, incorrect adjustment of the operating parameters of the drive, incorrect matching of the drive to the motor, incorrect installation, unacceptable dust, moisture, corrosive substances, excessive vibration or ambient temperatures outside of the design specification.

The local distributor may offer different terms and conditions at their discretion, and in all cases concerning warranty, the local distributor should be contacted first.

**This user guide is the "original instructions" document. All non-English versions are translations of the "original instructions".**

The contents of this User Guide are believed to be correct at the time of printing. In the interest of a commitment to a policy of continuous improvement, the manufacturer reserves the right to change the specification of the product or its performance or the contents of the User Guide without notice.

## This User Guide is for use with version 2.51 Firmware. The firmware version can be viewed in parameter P0-28. User Guide Revision 3.12

Invertek Drives Ltd adopts a policy of continuous improvement and whilst every effort has been made to provide accurate and up to date information, the information contained in this User Guide should be used for guidance purposes only and does not form the part of any contract.

	When installing the drive on any power supply where the phase-ground voltage may exceed the phase-phase voltage (typically IT supply networks or Marine vessels) it is essential that the internal EMC filter ground and surge protection varistor ground (where fitted) are disconnected. If in doubt, refer to your Sales Partner for further information.
	This manual is intended as a guide for proper installation. Invertek Drives Ltd cannot assume responsibility for the compliance or the non-compliance to any code, national, local or otherwise, for the proper installation of this drive or associated equipment. A hazard of personal injury and/or equipment damage exists if codes are ignored during installation.
	This Optidrive contains high voltage capacitors that take time to discharge after removal of the main supply. Before working on the drive, ensure isolation of the main supply from line inputs. Wait ten (10) minutes for the capacitors to discharge to safe voltage levels. Failure to observe this precaution could result in severe bodily injury or loss of life.
	Only qualified electrical personnel familiar with the construction and operation of this equipment and the hazards involved should install, adjust, operate, or service this equipment. Read and understand this manual and other applicable manuals in their entirety before proceeding. Failure to observe this precaution could result in severe bodily injury or loss of life.

# 1. Introduction

## 1.1. Important Safety Information

Please read the **IMPORTANT SAFETY INFORMATION** below, and all **Warning** and **Caution** information elsewhere.

**Danger:** Indicates a risk of electric shock, which, if not avoided, could result in damage to the equipment and possible injury or death.

This variable speed drive product (Optidrive) is intended for professional incorporation into complete equipment or systems as part of a fixed installation. If installed incorrectly it may present a safety hazard. The Optidrive uses high voltages and currents, carries a high level of stored electrical energy, and is used to control mechanical plant that may cause injury. Close attention is required to system design and electrical installation to avoid hazards in either normal operation or in the event of equipment malfunction. Only qualified electricians are allowed to install and maintain this product.

System design, installation, commissioning and maintenance must be carried out only by personnel who have the necessary training and experience. They must carefully read this safety information and the instructions in this Guide and follow all information regarding transport, storage, installation and use of the Optidrive, including the specified environmental limitations.

Do not perform any flash test or voltage withstand test on the Optidrive. Any electrical measurements required should be carried out with the Optidrive disconnected. Internal surge arrestors are fitted, intended to protect against damage due to mains borne spikes, which will result in the product failing the flash test.

Electric shock hazard! Disconnect and ISOLATE the Optidrive before attempting any work on it. High voltages are present at the terminals and within the drive for up to 10 minutes after disconnection of the electrical supply. Always ensure by using a suitable multimeter that no voltage is present on any drive power terminals prior to commencing any work.

Where supply to the drive is through a plug and socket connector, do not disconnect until 10 minutes have elapsed after turning off the supply.

Ensure correct earthing connections and cable selection as per defined by local legislation or codes. The drive may have a leakage current of greater than 3.5mA; furthermore the earth cable must be sufficient to carry the maximum supply fault current which normally will be limited by the fuses or MCB. Suitably rated fuses or MCB should be fitted in the mains supply to the drive, according to any local legislation or codes.

Do not carry out any work on the drive control cables whilst power is applied to the drive or to the external control circuits.

**Danger:** Indicates a potentially hazardous situation other than electrical, which if not avoided, could result in damage to property.

Within the European Union, all machinery in which this product is used must comply with Directive 98/37/EC, Safety of Machinery. In particular, the machine manufacturer is responsible for providing a main switch and ensuring the electrical equipment complies with EN60204-1.

The level of integrity offered by the Optidrive control input functions – for example stop/start, forward/reverse and maximum speed, is not sufficient for use in safety-critical applications without independent channels of protection. All applications where malfunction could cause injury or loss of life must be subject to a risk assessment and further protection provided where needed.

The driven motor can start at power up if the enable input signal is present.

The STOP function does not remove potentially lethal high voltages. ISOLATE the drive and wait 10 minutes before starting any work on it. Never carry out any work on the Drive, Motor or Motor cable whilst the input power is still applied.

The Optidrive can be programmed to operate the driven motor at speeds above or below the speed achieved when connecting the motor directly to the mains supply. Obtain confirmation from the manufacturers of the motor and the driven machine about suitability for operation over the intended speed range prior to machine start up.

Do not activate the automatic fault reset function on any systems whereby this may cause a potentially dangerous situation.

IP55 drives can be installed in a pollution degree 2 environment. IP66 outdoor drives can be installed in a pollution degree 4 environment. IP20 drives must be installed in a pollution degree 1 environment. If it is necessary to install IP20 drives in an environment with a higher pollution degree, then the drive must be installed inside an enclosure that provides the drive with a pollution degree 1 environment.

Optidrives are intended for indoor use only, unless specifically stated as being suitable for installation outdoors and installed in accordance with the Manufacturers guidelines.

When mounting the drive, ensure that sufficient cooling is provided. Do not carry out drilling operations with the drive in place, dust and swarf from drilling may lead to damage.

The entry of conductive or flammable foreign bodies should be prevented. Flammable material should not be placed close to the drive.

Relative humidity must be less than 95% (non-condensing).

Ensure that the supply voltage, frequency and no. of phases (1 or 3 phase) correspond to the rating of the Optidrive as delivered.

Never connect the mains power supply to the Output terminals U, V, W.

Do not install any type of automatic switchgear between the drive and the motor. This may cause the drive protection to activate, resulting in a trip and loss of operation.

Wherever control cabling is close to power cabling, maintain a minimum separation of 100 mm and arrange crossings at 90 degrees.

Ensure that all terminals are tightened to the appropriate torque setting.

Do not attempt to carry out any repair of the Optidrive. In the case of suspected fault or malfunction, contact your local Invertek Drives Sales Partner for further assistance.

## 1.2. Quick Start Process

Step	Action	See Section	Page
1	Identify the Model Type and ratings of your drive from the model code on the label. In particular: <ul style="list-style-type: none"><li>- Check the voltage rating suits the incoming supply</li><li>- Check the output current capacity meets or exceeds the full load current for the intended motor</li><li>- Check the enclosure type is suitable for the intended mounting location.</li></ul>	2.1. Identifying the Drive by Model Number 2.3. Understanding the Rating Label 2.4. Drive Model Numbers – IP20 2.5. Drive Model Numbers – IP55 2.6. Drive Model Numbers – IP66 3.1. General	6 7 7 9 10 12
2	Unpack and check the drive. Notify the supplier and shipper immediately of any damage.		
3	Ensure correct ambient and environmental conditions for the drive are met by the proposed mounting location.	11.1. Environmental	78
4	Install the drive in a suitable cabinet (IP20 Units), ensuring suitable cooling air is available. Mount the drive to the wall or machine (IP55 & IP66).	3.1. General 3.2. Before Installation 3.5. Mechanical Dimensions and Weight 3.6. Guidelines for Enclosure Mounting (IP20 Units) 3.7. Mounting the Drive – IP20 Units 3.9. Guidelines for Mounting (IP55 Units) 3.10. Guidelines for Mounting (IP66 Units)	12 12 13 16 17 18 19
5	Select the correct power and motor cables according to local wiring regulations or code, noting the maximum permissible sizes.	11.3. Input/Output Power and Current Ratings	78
6	For IT Supply network, or any power supply type where the phase – earth voltage may exceed the phase – phase voltage (such as ungrounded supplies), disconnect the EMC filter before connecting the supply.	11.8. Internal EMC Filter and Varistors – Disconnection Procedure	85
7	Check the supply cable and motor cable for faults or short circuits.		
8	Route the cables		
9	Check that the intended motor is suitable for use, noting any precautions recommended by the supplier or manufacturer.	4.6. Control Terminal Wiring 9.3. Parameter Group 4 – High Performance Motor Control	28 55
10	Check the motor terminal box for correct Star or Delta configuration where applicable.	4.5. Motor Terminal Box Connections	27
11	Ensure correct wiring protection is providing, by installing a suitable circuit breaker or fuses in the incoming supply line.	4.3.4. Fuse / Circuit Breaker Selection	26
12	Connect the power cables, especially ensuring the protective earth connection is made.	4.1. Connection Diagram	24
13	Connect the control cables as required for the application.	4.7. Control Terminal Connections	29
14	Thoroughly check the installation and wiring.		
15	Commission the drive parameters.	5.4. Changing Parameters 7. Parameters	38 42

## 2. General Information and Ratings

### 2.1. Identifying the Drive by Model Number

Each drive can be identified by its model number, shown below. The model number is on the shipping label and the drive nameplate. The model number includes the drive and factory fitted options.

### 2.2. Product Rating Label Location

All Optidrive Eco models carry a rating label, which can be located as follows:

On right hand side when viewed from the front.

## 2.3. Understanding the Rating Label

The product rating label provides the following information.

Key	
1	Model Code
2	Enclosure Type and IP Rating
3	Firmware Version
4	Serial Number
5	Technical Data – Supply Voltage
6	Technical Data – Maximum continuous output current

## 2.4. Drive Model Numbers – IP20

Mechanical dimensions and mounting information are shown from section 3.5.3. IP66 Units on page 15. Electrical specifications are shown in section 11.3. Input/Output Power and Current Ratings on page 78.

200 – 240 Volt, 1 Phase Input					
Model Code	Frame	kW	HP	Amps	Low Harmonic
ODV-3-220043-1F12-MN	2	0.75	1	4.3	No

### **2.6.1. Low Harmonic Variants**

The majority of the Optidrive Eco product range is based on a low harmonic solution using film capacitor technology to achieve compliance with EN 61000-3-12 without the need for any additional equipment. This standard specifies limits for harmonic currents for equipment connected to public low-voltage systems with input current > 16A and <= 75A per phase. It is important to understand which models from the product range are of the low harmonic technology which is detailed below.

The Optidrive Eco three phase 200V (200-240V) input and three phase 400V (380-480V) input drives frame sizes 2 up to and including frame size 5 are a lower harmonic drive using film capacitor technology. Please refer to the product rating tables in section 2.6. Drive Model Numbers – IP66 on page 10 for confirmation.

In short, this means that the low harmonic drives do not require an input choke and should not have one installed – drives outside of the above frame sizes and supply voltage / number of phases, are of standard electrolytic capacitor design and could benefit from the use of input chokes if further harmonic reduction is required.

## 3. Mechanical Installation

### 3.1. General

- The Optidrive should be mounted in a vertical position only, on a flat, flame resistant, vibration free mounting using the integral mounting holes.
- Do not mount flammable material close to the Optidrive.
- Ensure that the minimum cooling air gaps, as detailed in sections 3.6. Guidelines for Enclosure Mounting (IP20 Units) on page 16, 3.9. Guidelines for Mounting (IP55 Units) on page 18 and 3.10. Guidelines for Mounting (IP66 Units) on page 19 are left clear.
- Ensure that the ambient temperature range does not exceed the permissible limits for the Optidrive given in section 11.1. Environmental on page 78.
- Provide suitable clean, moisture and contaminant free cooling air sufficient to fulfil the cooling requirements of the Optidrive.

### 3.2. Before Installation

- Carefully unpack the Optidrive and check for any signs of damage. Notify the shipper immediately if any exist.
- Check the drive rating label to ensure it is of the correct type and power requirements for the application.
- To prevent accidental damage always store the Optidrive in its original box until required. Storage should be clean and dry and within the temperature range -40°C to +60°C.

### 3.3. UL Compliant Installation

Note the following for UL-compliant installation:

- For an up to date list of UL compliant products, please refer to UL listing NMMS.E226333.
- The drive can be operated within an ambient temperature range as stated in section 11.1. Environmental on page 78.
- UL Listed ring terminals / lugs must be used for all bus bar and grounding connections.

Refer to section 11.6. Additional Information for UL Compliance on page 83.

### 3.4. Installation Following a Period of Storage

Where the drive has been stored for some time prior to installation, or has remained without the main power supply present for an extended period of time, it is necessary to reform the DC capacitors within the drive according to the following table before operation. For drives which have not been connected to the main power supply for a period of more than 2 years, this requires a reduced mains voltage mains voltage to be applied for a time period, and gradually increased prior to operating the drive. The voltage levels relative to the drive rated voltage, and the time periods for which they must be applied are shown in the following table. Following completion of the procedure, the drive may be operated as normal.

**NOTE** This is only valid for non low harmonic version - see section 2.6.1. Low Harmonic Variants on page 11.

Storage Period /Power-OFF Period	Initial Input Voltage Level	Time Period T1	Secondary Input Voltage Level	Time Period T2	Third Input Voltage Level	Time Period T3	Final Input Voltage Level	Time Period T4
Up to 1 Year	100%				N/A			
1 – 2 Years	100%	1 Hour				N/A		
2 – 3 Years	25%	30 Minutes	50%	30 Minutes	75%	30 Minutes	100%	30 Minutes
More than 3 Years	25%	2 Hours	50%	2 Hours	75%	2 Hours	100%	2 Hours

### 3.5. Mechanical Dimensions and Weight

#### 3.5.1. IP20 Units

Drive Size	A		B		C		D		E		Weight	
	mm	in	Kg	lb								
2	221	8.70	110	4.33	185	7.28	209	8.23	63	2.48	1.8	4.0
3	261	10.28	131	5.16	205	8.07	247	9.72	80	3.15	3.5	7.7
4	418	16.46	172	6.77	240	9.45	400	15.75	125	4.92	10.4	22.9
5	486	19.13	233	9.17	260	10.24	460	18.11	175	6.89	19.9	43.8
6A	614	24.17	286	11.25	320	12.59	588	23.14	200	7.87	42.5	93.5
6B	726	28.58	330	13	320	12.59	692	27.24	225	8.85	43.5	95.7
8	974	38.34	444	17.48	423	16.65	924	36.37	320	12.59	124.5	274.4

Mounting Bolts			Tightening Torques			
Frame Size	Metric	UNF		Frame Size	Required Torque	Terminal Type
2	M4	#8	Control Terminals	All	0.5 Nm	4.5 lb-in
3	M4	#8		2 & 3	1 Nm	9 lb-in
4	M8	5/16		4	2 Nm	18 lb-in
5	M8	5/16		5	4 Nm	35.5 lb-in
6A	M8	5/16		6A	12 Nm	9 lb-ft
6B	M10	3/8		6B	15 Nm	11 lb-ft
8	M12	7/16		8	60 Nm	42 lb-ft
Power Terminals						

#### NOTE

\*The IP20 Frame Size 4 Chassis can obstruct the rotation (tightening) of a bolt or screw with a hex head, a fixing with a round head will be most suitable for the mounting of this unit.

## Mechanical Installation

	8	60 Nm	42 lb-ft
Power Terminals		M12 Stud	

### 3.5.3. IP66 Units

Drive Size	A		B		C		D		E		F		Weight	
	mm	in	mm	in	mm	in	mm	in	mm	in	mm	in	kg	lb
2	257	10.12	188	7.40	182	7.16	200	7.87	176	6.93	172	6.77	3.5	7.7
2A	257	10.12	188	7.40	211	8.31	200	7.87	178	7.00	196	7.72		
3	310	12.20	211	8.31	235	9.25	252	9.92	197	7.75	225	8.86	6.6	14.5
4	360	14.17	240	9.45	271	10.67	300	11.81	227	8.94	260	10.24	9.5	20.9

#### NOTE

Measurement C is only valid for the version with the disconnect.

Frame size 2A is shown for the 5.5kW Frame size 2 as this requires a deeper heatsink with a fan.

Mounting Bolts			Tightening Torques				
Frame Size	Metric	UNF		Frame Size	Required Torque	Terminal Type	
All Sizes	M4	#8	Control Terminals	All	0.5 Nm	4.5 lb-in	Rising Clamp
Power Terminals			2 & 3	0.8 Nm	7 lb-in	Rising Clamp	
			4	2 Nm	19 lb-in	Rising Clamp	

### 3.6. Guidelines for Enclosure Mounting (IP20 Units)

- IP20 drives are designed to be installed in suitable enclosures to protect them from the environment.
- Enclosures should be made from a thermally conductive material.
- Ensure the minimum air gap clearances around the drive as shown below are observed when mounting the drive.
- Where ventilated enclosures are used, there should be venting above the drive and below the drive to ensure good air circulation. Air should be drawn in below the drive and expelled above the drive.
- In any environments where the conditions require it, the enclosure must be designed to protect the Optidrive against ingress of airborne dust, corrosive gases or liquids, conductive contaminants (such as condensation, carbon dust, and metallic particles) and sprays or splashing water from all directions.
- High moisture, salt or chemical content environments should use a suitably sealed (non-vented) enclosure.

The enclosure design and layout should ensure that the adequate ventilation paths and clearances are left to allow air to circulate through the drive heatsink. Invertek Drives recommend the following minimum sizes for drives mounted in non-ventilated metallic enclosures:

Drive Size	X Above & Below		Y Either Side		Z Between	
	mm	in	mm	in	mm	in
2	75	2.95	10	0.39	46	1.81
3	100	3.94	10	0.39	52	2.05
4	200	7.87	25	0.98	70	2.76
5	200	7.87	25	0.98	70	2.76
6A	200	7.87	25	0.98	70	2.76
6B	200	7.87	25	0.98	70	2.76
8	350	11.81	50	3.94	412	16.22

#### NOTE

Dimension Z assumes that the drives are mounted side-by-side with no clearance.

Typical drive heat losses are <3% of operating load conditions.

Above are guidelines only and the operating ambient temperature of the drive MUST be maintained at all times.

### 3.7. Mounting the Drive – IP20 Units

- IP20 Units are intended for installation within a control cabinet.
- When mounting with screws:
  - Using the drive as a template, or the dimensions shown above, mark the locations for drilling
  - Ensure that when mounting locations are drilled, the dust from drilling does not enter the drive
  - Mount the drive to the cabinet backplate using suitable mounting screws
  - Position the drive, and tighten the mounting screws securely.
- When Din Rail Mounting (Frame Size 2 Only):
  - Locate the DIN rail mounting slot on the rear of the drive onto the top of the DIN rail first
  - Press the bottom of the drive onto the DIN rail until the lower clip attaches to the DIN rail
  - If necessary, use a suitable flat blade screw driver to pull the DIN rail clip down to allow the drive to mount securely on the rail
  - To remove the drive from the DIN rail, use a suitable flat blade screwdriver to pull the release tab downwards, and lift the bottom of the drive away from the rail first.

### 3.8. Drive Enclosure Dimensioning

The IP20 drives are intended to be mounted in suitable enclosures. It is very important to ensure that the enclosure is designed appropriately to keep the drive ambient temperature within acceptable levels.

Calculating the panel size for a completely sealed panel without any ventilation:

The external surface area which is free to radiate heat to the environment must be great enough to dissipate the heat generated inside the panel – If any surface is against a wall or the floor then the corresponding surface area should be excluded from this calculation.

The required panel surface area can be calculated according to the following:

- $A = P / K \times (T_{MAX} - T_{AMB})$

Where

- A = Control Panel Surface Area in square metres which is free to radiate heat to the air (areas mounted against the wall or floor are excluded)
- P = Total power dissipated in panel (include all losses from all power devices)
- K = Thermal constant, typically 5.5 for painted mild steel
- $T_{MAX}$  = Maximum temperature allowed in the panel (ambient temperature for the drive)
- $T_{AMB}$  = Maximum ambient temperature around the panel

If the panel is to be ventilated using cooling fans and filters, the required airflow can be determined as follows:

- $F = 0.053 \times P / (T_{MAX} - T_{AMB})$

Where

- F = Airflow in Cubic metres per minute
- P = Total power dissipated in panel (include all losses from all power devices)
- $T_{MAX}$  = Maximum temperature allowed in the panel (ambient temperature for the drive)
- $T_{AMB}$  = Maximum ambient temperature around the panel

### 3.9. Guidelines for Mounting (IP55 Units)

- Before mounting the drive, ensure that the chosen location meets the environmental condition requirements for the drive shown in section 11.1. Environmental on page 78.
- The drive must be mounted vertically, on a suitable flat surface.
- The minimum mounting clearances as shown in the table below must be observed.
- The mounting site and chosen mountings should be sufficient to support the weight of the drives.
- IP55 units do not require mounting inside an electrical control cabinet; however they may be if desired.
- Using the drive as a template, or the dimensions shown above, mark the locations required for drilling
- Suitable cable glands to maintain the IP protection of the drive are required. Gland sizes should be selected based on the number and size of the required connection cables. Drives are supplied with a plain, undrilled gland plate to allow the correct hole sizes to be cut as required. Remove the gland plate from the drive prior to drilling.

Drive Size	X - Above & Below		Y - Either Side	
	mm	in	mm	in
4 (IP55)	200	7.9	10	0.394
5 (IP55)	200	7.9	10	0.394
6 (IP55)	200	7.9	10	0.394
7 (IP55)	200	7.9	10	0.394
8 (IP55)	350	13.78	50	1.97

#### NOTE

Typical drive heat losses are approximately 3% of the operating load power.

The above dimensions are for guidance only, the operating ambient temperature of the drive MUST be maintained within the specified limits or allowed derating at all times.

### 3.10. Guidelines for Mounting (IP66 Units)

- Before mounting the drive, ensure that the chosen location meets the environmental condition requirements for the drive shown in section 11.1. Environmental on page 78.
- The drive must be mounted vertically, on a suitable flat surface.
- The minimum mounting clearances as shown in the table below must be observed.
- The mounting site and chosen mountings should be sufficient to support the weight of the drives.
- Using the drive as a template, or the dimensions shown above, mark the locations required for drilling.
- Suitable cable glands to maintain the ingress protection of the drive are required. Gland holes for power and motor cables are pre-moulded into the drive enclosure, recommended gland sizes are shown below. Gland holes for control cables may be cut as required.
- The mounting location should be free from vibration.
- Do not mount the drive in any area with excessive corrosive airborne chemicals or potentially dangerous dust particles.
- Avoid mounting close to high heat sources.
- The drive must not be mounted in direct sunlight. If necessary, install a suitable shade cover.
- The mounting location must be free from frost.
- Do not restrict the flow of air through the drive heatsink. The drive generates heat which must be naturally allowed to dissipate. Correct air clearance around the drive must be observed.
- If the location is subject to wide ambient temperature and air pressure variation, install a suitable pressure compensation valve in the drive gland plate.

Drive Size	X Above & Below		Y Either Side	
	mm	in	mm	in
2	200	7.87	10	0.39
3	200	7.87	10	0.39
4	200	7.87	10	0.39

**NOTE**

**Above are guidelines only and the operating ambient temperature of the drive MUST be maintained within the limits shown in section 11.1. Environmental at all times.**

### 3.11. Gland Plate

The use of a suitable gland system is required to maintain the appropriate IP / NEMA rating. The gland plate has pre moulded cable entry holes for power and motor connections suitable for use with glands as shown in the following table. Where additional holes are required, these can be drilled to suitable size. Please take care when drilling to avoid leaving any particles within the product.

#### Recommended cable gland types and hole sizes

Power & Motor Cables			
Drive Size	Hole Size	Recommended PG Gland	Alternative Metric gland
Size 2 & 3	27	PG21	M25
Size 4	37	PG29	-

- UL rated ingress protection ("Type" ) is only met when cables are installed using a UL recognized bushing or fitting for a flexible-conduit system which meets the required level of protection ("Type").
- For conduit installations the conduit entry holes require standard opening to the required sizes specified per the NEC.
- Not intended for installation using rigid conduit system.

#### IP66 / NEMA 4X Gland Plate

### 3.12. Installing the IP66 Sun Shade

Frame Size	Part Number
2	66-ODS2H-9016
3 & 4	66-ODS3H-9016

An IP66 Sun Shade should always be fitted (in accordance with these instructions) where the product is installed outdoors, and there is a possibility for the display of the drive to come into the path of direct sunlight or where there is possibility of snow, ice, or other particles accumulating on the top of the drive.

#### Recommended clearance before installation

Ensure you have at least 30mm either side and 100mm above the drive to allow sufficient space for installation of the IP66 Sun Shade.

#### Installing the IP66 Sun Shade

Install the Optidrive following the instructions in the User Guide. Place the IP66 Sun Shade over the Optidrive and slide down until it slots on top of the heat sink, then fix in place using the mounting holes.

Drive Size	A		B		C		D		E		F		G		H		Hole Size		Weight

### 3.13. Removing the Terminal Cover

#### 3.13.1. IP55 Frame Size 4

#### 3.13.2. IP55 Frame Size 5

#### 3.13.3. IP55 Frame Sizes 6 & 7

#### Terminal Cover Release Screws

Using a suitable screwdriver, unscrew the securing screws and remove the cover.

### 3.13.4. IP20 & IP55 Frame Size 8

#### Terminal Cover Release Screws

Using a suitable screwdriver, unscrew the ten securing screws indicated and remove the cover.

### 3.13.5. IP66 Frame Sizes 2 & 3

#### Terminal Cover Release Screws

Remove the front cover by rotating the screws in an anti-clockwise direction.

### 3.13.6. IP66 Frame Size 4

### 3.14. Routine Maintenance

The drive should be included within the scheduled maintenance program so that the installation maintains a suitable operating environment, this should include:

- Ambient temperature is at or below that set out in the section *11.1. Environmental* on page 78, with any relevant derating applied.
- Heat sink fans (where fitted) freely rotating and are dust free.
- If the drive is mounted within an enclosure:
  - Ensure this is free from dust and condensation.
  - Ensure sufficient ventilation of clean cooling air is provided.
  - Ensure any panel ventilation fans and air filters are clean and provide the correct required air flow.
- Checks should also be made on all electrical connections, ensuring screw terminals are correctly torqued; and that power cables have no signs of heat damage.

### 3.15. IP66 (NEMA 4X) Lock Off

#### Mains switch-disconnector Lock Off

On the switched models the mains switch-disconnector can be locked in the 'Off' position using a 20mm standard shackle padlock (not supplied).

#### IP66 / NEMA 4X Unit Lock Off

# 4. Electrical Installation

## 4.1. Connection Diagram

All power terminal locations are marked directly on the product. IP20 Frame Size 2 – 4 units have AC power input located at the top with the motor connections located at the bottom. All other units have power terminals located at the bottom.

### 4.1.1. Electrical Power Connections

**NOTE** Enclosed drives are not suitable for rigid conduit system connection.

	This manual is intended as a guide for proper installation. Invertek Drives Ltd cannot assume responsibility for the compliance or the non-compliance to any code, national, local or otherwise, for the proper installation of this drive or associated equipment. A hazard of personal injury and/or equipment damage exists if codes are ignored during installation.
	This Optidrive contains high voltage capacitors that take time to discharge after removal of the main supply. Before working on the drive, ensure isolation of the main supply from line inputs. Wait ten (10) minutes for the capacitors to discharge to safe voltage levels. Failure to observe this precaution could result in severe bodily injury or loss of life.
	Only qualified electrical personnel familiar with the construction and operation of this equipment and the hazards involved should install, adjust, operate, or service this equipment. Read and understand this manual and other applicable manuals in their entirety before proceeding. Failure to observe this precaution could result in severe bodily injury or loss of life.

## 4.2. Protective Earth (PE) Connection

### 4.2.1. Grounding Guidelines

Adequate safety earthing must be provided in accordance with local wiring rules and codes of practice. The ground terminal of each Optidrive should be connected back to the common safety earth bar to maintain touch potentials within safe limits. The ground terminal of each Optidrive should be individually connected DIRECTLY to the site ground bus bar (through the EMC filter if installed). Optidrive ground connections should not loop from one drive to another, or to, or from any other equipment. Ground impedance must conform to local industrial safety regulations and/or electrical codes.

To meet UL regulations, UL approved ring crimp terminals should be used for all ground wiring connections.

The integrity of all ground connections should be checked periodically.

### 4.2.2. Protective Earth Conductor

The Cross sectional area of the PE Conductor must be at least equal to that of the incoming supply conductors.

### 4.2.3. Motor Ground

The driven motor must be locally connected to a suitable ground location to maintain touch potentials within safe limits. In addition, the motor ground must be connected to one of the ground terminals on the drive.

### 4.2.4. Ground Fault Monitoring

As with all inverters, a leakage current to earth can exist. The Optidrive is designed to produce the minimum possible leakage current whilst complying with worldwide standards. The level of current is affected by motor cable length and type, the effective switching frequency, the earth connections used and the type of RFI filter installed. If an ELCB (Earth Leakage Circuit Breaker) is to be used, the following conditions apply:

- A Type B Device must be used.
- A device with 10ms trip delay is recommended.
- Individual device should be used for each Optidrive.
- The device must be suitable for protecting equipment with a DC component in the leakage current.
- The device should be not sensitive to high frequency leakage current.

### 4.2.5. Shield Termination (Cable Screen)

The safety ground terminal provides a grounding point for the motor cable shield. The motor cable shield connected to this terminal (drive end) should also be connected to the motor frame (motor end). Use a shield terminating or EMI clamp to connect the shield to the safety ground terminal, refer to section 4.9. EMC Compliant Installation on page 30.

## 4.3. Incoming Power Connection

Ensure there is at least 30 seconds between each power-on.

### 4.3.1. Suitability

All Optidrive Eco models are designed for use on a single phase or balanced three phase supply depending on the model.

For all models and ratings when working with an IT Supply network, or any power supply type where the phase to earth voltage may exceed the phase to phase voltage (such as ungrounded supplies), the internal EMC filter and surge protection must be disconnected before connecting the supply. Refer to section 11.8. Internal EMC Filter and Varistors – Disconnection Procedure on page 85 for further information.

For three phase supply models, a maximum of 3% imbalance is allowed between phases.

For compliance with CE and C Tick EMC requirements, refer to section 4.9. EMC Compliant Installation on page 30.

- A fixed installation is required according to IEC61800-5-1 with a suitable disconnecting device installed between the Optidrive and the main Power Source. The disconnecting device must conform to the local safety code / regulations (e.g. within Europe, EN60204-1, Safety of machinery).

### 4.3.2. Connection

- For 1 phase ac supply, power should be connected to L1/L, L2/N.
- For a DC Supply, the main power cables should be connected to L1/L, L2/N.
- For 3 phase ac supplies, the mains power cables should be connected to L1, L2, and L3. Phase sequence is not important. Neutral connection is not required.

### 4.3.3. Cable Selection

- The cables should be dimensioned according to any local codes or regulations. Maximum dimensions for each drive model are given in section 11.3. Input/Output Power and Current Ratings on page 78.
- For installation within the European Union, cable type should be selected according to section 4.9. EMC Compliant Installation on page 30.

#### 4.3.4. Fuse / Circuit Breaker Selection

- Suitable fuses to provide wiring protection of the input power cable should be installed in the incoming supply line, according to the data in section 11.3. *Input/Output Power and Current Ratings* on page 78.
- The fuses must comply with any local codes or regulations in place. In general, type gG (IEC 60269) or UL type J fuses are suitable (exception: Eaton Bussmann FWP series must be used for size 6A & 6B IP20 models); however in some cases type aR fuses may be required. The operating time of the fuses must be below 0.5 seconds.
- Where allowed by local regulations, suitably dimensioned type B MCB circuit breakers of equivalent rating may be utilised in place of fuses, providing that the clearing capacity is sufficient for the installation.
- For UL compliant installations, fuses must be used, refer to section 11.6. *Additional Information for UL Compliance* on page 83.
- Please refer to chapter 11.4. *Input Power Supply Requirements* on page 82 for actual supply short-circuit capacity limits for each drive.
- The Optidrive provides thermal and short circuit protection for the connected motor and motor cable.

#### 4.3.5. Input Chokes

- The majority of the Optidrive Eco product range is based on a low harmonic solution using film capacitor technology to achieve compliance with EN 61000-3-12 without the need for any additional equipment. This standard specifies limits for harmonic currents for equipment connected to public low-voltage systems with input current > 16A and <= 75A per phase. It is important to understand which models from the product range are of the low harmonic technology which is detailed below.
- The Optidrive Eco three phase 200V (200-240V) input and three phase 400V (380-480V) input drives frame sizes 2 up to and including frame size 5 are a lower harmonic drive using film capacitor technology.
- In short, this means that the low harmonic drives do not require an input choke and should not have one installed – drives outside of the above frame sizes and supply voltage / number of phases, could benefit from the use of input chokes if further harmonic reduction is required.
- The low harmonic drives must NOT be used with input chokes. Please see section 2.6.1. *Low Harmonic Variants* on page 11 for a description of which drives fall into the low harmonic category. Input chokes may be required on the standard (non low harmonic) drives to reduce the harmonics generated or if the incoming supply impedance is low or the fault level / short circuit current is high.

<b>Drive Supply</b>	<b>Drive Rating</b>	<b>IP20 AC Input Inductor</b>	<b>IP66 AC Input Inductor</b>
230V 1 Phase Input	0.75kW	OPT-2-L1016-20	OPT-2-L1016-66
	1.5 - 2.2kW	OPT-2-L1025-20	OPT-2-L1025-66
400V 3 Phase Input	55 - 90kW	OPT-2-L3200-00	N/A
	110 - 160kW	OPT-2-L3300-00	
	200 - 250kW	OPT-L3500-00 (4%)	
		OPT-2L31500-00 (1%)	
600V 3 Phase	0.75 - 2.2kW	N/A	OPT-2-L3006-66
	4.0 - 5.5kW		OPT-2-L3010-66
	7.5 - 11kW		OPT-2-L3018-66

## 4.4. Motor Connection

- The drive inherently produces fast switching of the output voltage (PWM) to the motor compared with operation of the motor directly from the mains supply. Most modern industrial motors are wound for operation with a variable speed drive and will have insulation rated accordingly. However, on some motors the quality of insulation may be insufficient or unknown. In such cases the motor manufacturer should be consulted and preventative measures may be required prior to operating with the drive.
- The motor should be connected to the Optidrive U, V, and W terminals using a suitable 3 or 4 core cable. Where a 3 core cable is utilised, with the shield operating as an earth conductor, the shield must have a cross sectional area at least equal to the phase conductors when they are made from the same material. Where a 4 core cable is utilised, the earth conductor must be of at least equal cross sectional area and manufactured from the same material as the phase conductors.
- Automatic switchgear should not be installed between the drive output and the motor, opening and closing contacts in this circuit whilst the drive is energised will inevitably reduce the lifetime of the drive and could cause product failure. If an isolator is required to be placed between the drive and the motor in order to comply with local regulations, the device must not be operated when the drive is running.
- For installation within the European Union, refer to section 4.9. EMC Compliant Installation on page 30. For all installations it is recommended to use an overall shielded cable or take measures such as installation within metal tube or duct work to prevent electromagnetic radiation which may cause disturbance to other equipment or increase bearing currents in motors.

The motor earth must be connected to one of the Optidrive earth terminals to provide a low impedance path for common mode leakage current to return to the drive.

## 4.5. Motor Terminal Box Connections

Most general purpose motors are wound for operation on dual voltage supplies. This is indicated on the nameplate of the motor. This operational voltage is normally selected when installing the motor by selecting either STAR or DELTA connection. STAR always gives the higher of the two voltage ratings.

Incoming Supply Voltage	Motor Nameplate Voltages	Connection
230	230 / 400	Delta △
400 / 460	400 / 690	
575	575 / 1000	
400	230 / 400	Star λ
575	330 / 575	

## 4.6. Control Terminal Wiring

- All analog signal cables should be suitably shielded. Double shielded twisted pair cables are recommended for analog signal cables.
- Power and Control Signal cables must be routed separately where possible, and must not be routed parallel to each other.
- Observe the minimum recommended distance between cables shown in section 4.9. EMC Compliant Installation on page 30.
- Signal levels of different voltages e.g. 24 Volt DC and 110 Volt AC, should not be routed in the same cable.
- Maximum control terminal tightening torque is 0.5Nm.
- Control Cable entry conductor size: 0.05 – 2.5mm<sup>2</sup> / 30 – 12 AWG.

### 4.6.1. Control Connections

**NOTE**

\* Dashed lines show connection for analog inputs in digital mode

\*\* Optional external 24 V DC power supply

Key	Default Function		Sec.	Page
	Open	Closed		
1 +24V DC	24 Volt DC Input / Output	On-board +24V DC Supply (100mA) or External 24V DC Input	4.7.1	29
2 DI 1	Digital Input 1 (Run Enable)	STOP	4.7.2	29
3 DI 2	Digital Input 2	FORWARD	4.7.2	29
4 DI 3	Digital Input 3	P1-12 Reference	4.7.2	29
5 +10V DC	+10V DC Output	On-board +10V DC Supply (10 mA)		
6 AI 1 / DI 4	Analog Input 1 / Digital Input 4	Speed Reference 1 (0-10V)	4.7.3	29
7 0V / COM	0 Volt Common	0V Common for AI/AO/DI/DO		
8 AO 1	Analog Output 1	Motor Speed (0-10V)	4.7.4	29
9 0V / COM	0 Volt Common	0V Common for AI/AO/DI/DO		
10 AI 2 / DI 5	Analog Input 2 / Digital Input 5	P2-01 Speed Ref.	4.7.3	29
11 AO 2	Analog Output 2	Motor Current (0-10V)	4.7.4	29
12 STO+	STO + 24V DC Connection	InHibit	4.10	33
13 STO-	STO 0 Volt Connection	Run Permit		
14 RL1-COM	Auxiliary Relay Output 1 Common		4.7.5	30
15 RL1-NO	Auxiliary Relay Output 1 Normally Open	Drive Healthy	4.7.5	30
16 RL1-NC	Auxiliary Relay Output 2 Normally Closed	Drive Faulty	4.7.5	30
17 RL2-A	Auxiliary Relay Output 2	Drive Stopped	4.7.5	30
18 RL2-B	Auxiliary Relay Output 2	Drive Running	4.7.5	30

**NOTE** Digital Inputs: Logic High = 8-30V DC (30V DC max)      Analog Outputs: 0 – 10 Volt / 4-20mA (20mA max)

SAFE TORQUE OFF input: Logic High = 18-30V DC (Also refer to section 4.10. Safe Torque Off on page 33)

## 4.7. Control Terminal Connections

Example connection schematics are provided in section 8.3. Example Connection Schematics on page 46.

### 4.7.1. +24V DC Input / Output

When the mains power is applied to the drive, terminal 1 provides a +24V DC output, maximum load 100mA. This may be used to activate digital inputs or provide power to sensors.

When no mains power is applied to the drive, the drive control electronics may be powered from an external +24V DC source. When powered in this way, all analog and digital I/O and communication functions remain operative, however the motor may not be operated, which allows safe testing and commissioning of the installation without risk of high voltage being present. When powered in this way, the drive requires up to 100mA.

### 4.7.2. Digital Inputs

Up to five digital inputs are available. The function of the inputs is defined by parameters P1-12 and P1-13, which are explained in section 8. Control Terminal Functions on page 44.

### 4.7.3. Analog Inputs

Two analog inputs are available, which may also be used as digital inputs if required. The signal formats are selected by parameters as follows:

- Analog Input 1 Format Selection Parameter P2-30.
- Analog Input 2 Format Selection Parameter P2-33.

These parameters are described more fully in section 9.1. Parameter Group 2 – Extended Parameters on page 47.

The function of the analog input, e.g. for speed reference or PID feedback for example is defined by parameters P1-12 and P1-13. The function of these parameters and available options are described in section 8. Control Terminal Functions on page 44.

### 4.7.4. Analog Outputs

Two analog outputs are available, and may be used for 0 – 10 Volt Signal (max load 20mA), 0 – 20mA, 4 – 20mA or a digital +24Volt DC, 20mA output. The parameters to select function and format are as follows.

Analog Output	Function selected by	Format selected by
Analog Output 1	P2-11	P2-12
Analog Output 2	P2-13	P2-14

These parameters are described more fully in section 9.1. Parameter Group 2 – Extended Parameters on page 47.

#### 4.7.5. Auxiliary Relay Outputs

Two relay outputs are available, which are intended to be used to switch external resistive loads up to 5A at 230V AC or 30V DC. Relay 1 has both normally open and normally closed contacts available. Relay 2 provides a simple open or closed contact. The relay output function may be configured using parameters P2-15 and P2-18, which are described in section 9.1. Parameter Group 2 – Extended Parameters on page 47.

### 4.8. Motor Thermal Overload Protection

#### 4.8.1. Internal Thermal Overload Protection

Optidrive Eco has internal motor overload protection (current limit) set at 110% of the motor rated current (P1-08). This level may be adjusted in P4-07. The drive has an in-built motor thermal overload function; this is in the form of an "I<sub>t</sub>-trP" trip after delivering >100% of the value set in P1-08 (motor rated current) for a sustained period of time. The overload accumulator will permit a sustained overload for different durations before tripping as shown in the tables below:

**Constant Torque (P4-01 > 0)**

	<b>HD</b>	<b>SD</b>
110%	75 s	75 s
150%	15 s	15 s
175%	10 s	–
200%	7.5 s	–

**Variable Torque (P4-01 = 0)**

110%	75 s
150%	1 s
175%	–
200%	–

Where:

HD = Heavy Duty drive selection – this is where the rated current of the motor connected to the drive is less than 75% of the drive current rating

SD = Standard Duty drive selection – this is where the current rating of the motor connected to the drive is closely matched to the drive current rating

When operating in Variable Torque (P4-01 = 0), the oversizing of the drive makes no difference to the available duration of the overload condition.

**NOTE** The 45kW 400V Eco model (ODV-3-540900-3...) overload capability follows that shown in the variable torque table irrespective of the setting in P4-01.

#### 4.8.2. Motor Thermistor Connection

Where a motor thermistor is to be used, it should be connected as follows:

<b>Additional Information</b>												
▪ Compatible Thermistor: PTC Type, 2.5kΩ trip level.												
▪ Use a setting of P1-13 that has DI5/AI2 function as E-TRIP "External Trip", e.g. P1-13 = 6. Refer to section 8.1. Digital Input Configuration Parameter P1-13 on page 44 for further details.												
▪ Enable the Motor PTC Thermistor Input function in parameter P2-33.												

### 4.9. EMC Compliant Installation

#### 4.9.1. Installation within the UK and European Union

All equipment installed within the UK or European Union must comply with the applicable UK or European EMC Directive. The installer must be familiar with the Directive and appropriate good EMC practice. Invertek Drives' products may be considered as a Basic Drive Module or Complete Drive Module according to the EMC standard definition dependent on the drive type. The BDM or CDM may then be incorporated into a Power Drive System. It is the sole responsibility of the installer to ensure that the complete PDS is compliant with the Directive.

This section of the User Guide provides general guidance to ensure compliance can be achieved.

## 4.9.2. Recommended Installation for EMC Compliance

## 4.9.3. Recommended Cable Types by EMC Category

Number of Input Phases	Rated Supply Voltage	Frame Size	IP rating	Maximum Motor Cable Length to Achieve		
				C1 1, 2, 4, 5, 7	C2 3, 4, 5, 7	C3 6, 7
1	230	2	IP20, IP66	1 (5)	5 (25)	25 (100)
		2, 3, 4	IP20, IP66	1	5	25
		4, 5	IP20, IP55	1	5	25
		6A, 6B	IP20	-	100	100
		6, 7	IP55	-	-	25 (100)
		8 (with standard inbuilt filter)	IP20, IP55	-	5	25
		8 (with high performance additional filter)	IP20, IP55	-	100	100

### NOTE

- Data in brackets shows permissible cable length with additional external EMC filter.
- The 500 – 600V drives are not equipped with the internal EMC filter and are intended for use on second environment only.

**General**

<sup>1</sup> Compliance with category C1 conducted emissions only is achieved.

**Supply Cable**

- 2 A screened (shielded) cable suitable for fixed installation with the relevant mains voltage in use. Braided or twisted type screened cable where the screen covers at least 85% of the cable surface area, designed with low impedance to HF signals. Installation of a standard cable within a suitable steel or copper tube is also acceptable - in this case, ensure that metal tube is adequately grounded.
- 3 A cable suitable for fixed installation with relevant mains voltage with a concentric protection wire. Installation of a standard cable within a suitable steel or copper tube is also acceptable.

**Motor Cable**

- 4 A screened (shielded) cable suitable for fixed installation with the relevant voltage in use. Braided or twisted type screened cable where the screen covers at least 85% of the cable surface area, designed with low impedance to HF signals.
- 5 The cable shield should be terminated at the motor end using an EMC type gland allowing connection to the motor body through the largest possible surface area. The shield must also be terminated at the drive end, as close as practically possible to the drive output terminals. Where drives are mounted in a steel control panel enclosure, the cable screen may be terminated directly to the control panel backplate using a suitable EMC clamp or gland fitted as close to the drive as possible. The drive earth terminal must also be connected directly to this point, using a suitable cable which provides low impedance to high frequency currents. For IP55 and IP66 drives, connect the motor cable shield to the gland plate or internal ground clamp.
- 6 A cable suitable for fixed installation with relevant voltage with a concentric protection wire. Installation of a standard cable within a suitable steel or copper tube is also acceptable.

**Control Cable**

- 7 A shielded cable with low impedance shield. Double shielded twisted pair cable should be used for analog signals.

**4.9.4. Recommended Cable Connections**

IP55

IP20 Frame size 2, 3 &amp; 4

IP66

IP20 Frame size 5, 6A &amp; 6B

## 4.10. Safe Torque Off

Safe Torque OFF will be referred to as "STO" through the remainder of this section.

### 4.10.1. Responsibilities

The overall system designer is responsible for defining the requirements of the overall "Safety Control System" within which the drive will be incorporated; furthermore the system designer is responsible for ensuring that the complete system is risk assessed and that the "Safety control System" requirements have been entirely met and that the function is fully verified, this must include confirmation testing of the "STO" function before drive commissioning.

The system designer shall determine the possible risks and hazards within the system by carrying out a thorough risk and hazard analysis, the outcome of the analysis should provide an estimate of the possible hazards, furthermore determine the risk levels and identify any needs for risk reduction. The "STO" function should be evaluated to ensure it can sufficiently meet the risk level required.

### 4.10.2. What STO Provides

The purpose of the "STO" function is to provide a method of preventing the drive from creating torque in the motor in the absence of the "STO" input signals (Terminal 12 with respect to Terminal 13), this allows the drive to be incorporated into a complete safety control system where "STO" requirements need to be fulfilled.<sup>1</sup>

The "STO" function can typically eliminate the need for electro-mechanical contactors with cross-checking auxiliary contacts as per normally required to provide safety functions.<sup>2</sup>

The drive has the "STO" function built-in as standard and complies with the definition of "Safe torque off" as defined by IEC 61800-5-2:2007.

The "STO" function also corresponds to an uncontrolled stop in accordance with category 0 (Emergency Off), of IEC 60204-1. This means that the motor will coast to a stop when the "STO" function is activated, this method of stopping should be confirmed as being acceptable to the system the motor is driving.

The "STO" function is recognised as a fail-safe method even in the case where the "STO" signal is absent and a single fault within the drive has occurred, the drive has been proven in respect of this by meeting the following safety standards:

	<b>SIL (Safety Integrity Level)</b>	<b>PFHD (Probability of dangerous Failures per Hour)</b>	<b>SFF (Safe failure fraction %)</b>	<b>Lifetime assumed</b>
<b>EN 61800-5-2</b>	2	1.23E-09 1/h (0.12 % of SIL 2)	50	20 Yrs
	<b>PL (Performance Level)</b>	<b>CCF (%) (Common Cause Failure)</b>	<b>MTTFd</b>	<b>Category</b>
<b>EN ISO 13849-1</b>	PL d	1	4525a	3

	<b>SILCL</b>
<b>EN 62061</b>	SILCL 2

**NOTE** The values achieved above maybe jeopardised if the drive is installed outside of the Environmental limits detailed in section 11.1. Environmental on page 78.

### 4.10.3. What STO Does Not Provide

	Disconnect and ISOLATE the drive before attempting any work on it. The "STO" function does not prevent high voltages from being present at the drive power terminals.
	<sup>1</sup> <b>NOTE</b> The "STO" function does not prevent the drive from an unexpected re-start. As soon as the "STO" inputs receive the relevant signal it is possible (subject to parameter settings) to restart automatically, Based on this, the function should not be used for carrying out short-term non-electrical machinery operations (such as cleaning or maintenance work).
	<sup>2</sup> <b>NOTE</b> In some applications additional measures may be required to fulfil the systems safety function needs: the "STO" function does not provide motor braking. In the case where motor braking is required a time delay safety relay and/or a mechanical brake arrangement or similar method should be adopted, consideration should be made over the required safety function when braking as the drive braking circuit alone cannot be relied upon as a fail safe method.
	When using permanent magnet motors and in the unlikely event of multiple output power devices failing then the motor could effectively rotate the motor shaft by 180/p degrees (Where p denotes number of motor pole pairs).

#### 4.10.4. "STO" Operation

When the "STO" inputs are energised, the "STO" function is in a standby state, if the drive is then given a "Start signal/command" (as per the start source method selected in P1-13) then the drive will start and operate normally.

When the "STO" inputs are de-energised then the STO Function is activated and stops the drive (Motor will coast), the drive is now in "Safe Torque Off" mode.

To get the drive out of "Safe Torque Off" mode then any "Fault messages" need to be reset and the drive "STO" input needs to be re-energised.

#### 4.10.5. "STO" Status and Monitoring

There are a number of methods for monitoring the status of the "STO" input, these are detailed below:

##### Drive Display

In Normal drive operation (Mains AC power applied), when the drives "STO" input is de-energised ("STO" Function activated) the drive will highlight this by displaying "**InHibit**".

**NOTE** If the drive is in a tripped condition then the relevant trip will be displayed and not "InHibit".

##### Drive Output Relay

- Drive relay 1: Setting P2-15 to a value of "13" will result in relay opening when the "STO" function is activated.
- Drive relay 2: Setting P2-18 to a value of "13" will result in relay opening when the "STO" function is activated.

##### "STO" Fault Codes

Fault Code	Code Number	Description	Corrective Action
"Sto-F"	29	A fault has been detected within either of the internal channels of the "STO" circuit.	Refer to your Invertek Sales Partner

#### 4.10.6. "STO" Function Response Time

The total response time is the time from a safety related event occurring to the components (sum of) within the system responding and becoming safe. (Stop Category 0 in accordance with IEC 60204-1).

- The response time from the "STO" inputs being de-energised to the output of the drive being in a state that will not produce torque in the motor ("STO" active) is less than 1ms.
- The response time from the "STO" inputs being de-energised to the "STO" monitoring status changing state is less than 20ms.
- The response time from the drive sensing a fault in the STO circuit to the drive displaying the fault on the display/Digital output showing drive not healthy is less than 20ms.

#### 4.10.7. "STO" Electrical Installation

	The "STO" wiring shall be protected from inadvertent short circuits or tampering which could lead to failure of the "STO" input signal, further guidance is given in the diagrams below.
---	--

In addition to the wiring guidelines for the "STO" circuit below, section 4.9.2. Recommended Installation for EMC Compliance on page 31 should also be followed.

The drive should be wired as illustrated below; the 24V DC signal source applied to the "STO" input can be either from the 24V DC on the drive or from an External 24V DC power supply.

### 4.10.8. Recommended "STO" Wiring

#### Using an External 24V DC Power Supply

#### Using the Drives On-board 24V DC Supply

**NOTE** The Maximum cable length from Voltage source to the drive terminals should not exceed 25 mtrs.

### 4.10.9. External Power Supply Specification

<b>Voltage Rating (Nominal)</b>	24V DC
<b>STO Logic High</b>	18-30V DC (Safe torque off in standby)
<b>Current Consumption (Maximum)</b>	100mA

### 4.10.10. Safety Relay Specification

The safety relay should be chosen so that at minimum it meets the safety standards that the drive meets.

<b>Standard Requirements</b>	SIL2 or PLd SC3 or better (With Forcibly guided Contacts)
<b>Number of Output Contacts</b>	2 independent
<b>Switching Voltage Rating</b>	30V DC
<b>Switching Current</b>	100mA

### 4.10.11. Enabling the "STO" Function

The "STO" function is always enabled in the drive regardless of operating mode or parameter changes made by the user.

#### 4.10.12. Testing the “STO” Function

Before commissioning the system the “STO” function should always be tested for correct operation, this should include the following tests:

- With the motor at standstill, and a stop command given to the drive (as per the start source method selected in P1-13):
  - De-energise the “STO” inputs (Drive will display “InHibit”).
  - Give a start command (as per the start source method selected in P1-13) and check that the drive still displays “Inhibit” and that the operation is in line with the section 4.10.4. “STO” Operation on page 34 and section 4.10.5. “STO” Status and Monitoring on page 34.
- With the motor running normally (from the drive):
  - De-energise the “STO” inputs.
  - Check that the drive displays “Inhibit” and that the motor stops and that the operation is in line with the section 4.10.4. “STO” Operation on page 34 and section 4.10.5. “STO” Status and Monitoring on page 34.

#### 4.10.13. “STO” Function Maintenance

The “STO” function should be included within the control systems scheduled maintenance program so that the function is regularly tested for integrity (minimum once per year), furthermore the function should be integrity tested following any safety system modifications or maintenance work. If drive fault messages are observed refer to section 12.1. Fault Messages on page 86 for further guidance.

## 5. Keypad and Display Operation

The drive is configured and its operation monitored via the keypad and display.

### 5.1. Keypad and Display Layout

Control Keypad provides access to the drive parameters, and also allows control of the drive when Keypad Mode is selected in P1-12.

### 5.2. Selecting the Language on the TFT Display

ECO 01 <b>STOP</b> 15kW 400V 3Ph	Select Language Español Deutsch English	Select Language Español Deutsch English
Hold down the Start and Up keys for >1s	Use the Up and Down arrows to select a language.	Press the Navigate button to select.

#### 5.2.1. Operating Displays

Inhibit / STO Active	Drive Stopped	Drive Running Output Frequency Display	Drive Running Output Current Display	Drive Running Motor Power Display	Drive Running Motor Speed Display
ECO 01 <b>INHIBIT</b> 15kW 400V 3Ph	ECO 01 <b>STOP</b> 15kW 400V 3Ph	Output Frequency 01 <b>23.7Hz</b>	Motor Current 01 <b>15.3A</b>	Motor Power 01 <b>6.9kW</b>	Motor Speed 01 <b>718rpm</b>
Drive Inhibited. The STO connections are not made. Refer to section 4.10.8. Recommended "STO" Wiring on page 35.	Drive Stopped / Disabled.	Drive is enabled / running, display shows the output frequency (Hz). Press the Navigate key to select alternative displays.	Press the Navigate key for < 1 second. The display will show the motor current (Amps).	Press the Navigate key for < 1 second. The display will show the motor power (kW).	If P1-10 > 0, pressing the Navigate key for < 1 second will display the motor speed (Rpm).

### 5.3. Additional Display Messages

Auto Tuning in Progress	External 24VDC Supply	Overload	Fire Mode
<b>Auto-tuning</b>	<b>ECO 01</b> <b>Ext 24V</b>	<b>ECO 01</b> <b>OL 23.7Hz</b>	<b>Fire Mode</b>
	<b>External 24V mode</b>	<b>15.3A 6.9kW</b>	
			
Auto tune in progress. See parameter P4-02 information in section 9.3. Parameter Group 4 – High Performance Motor Control on page 55.	The drive control board is powered only from an external 24 Volt source, with no mains power applied.	Indicates an Overload condition. Output current exceeds the motor rated current entered in Parameter P1-08. LED display shows six flashing dots.	Display shows 'Fire Mode' flashing. LED shows no indication in display, but the fascia badge flashes.

Switching Frequency Reduction	Mains Loss	Maintenance Time Elapsed
<b>ECO 01</b> <b>SF↓ 23.7Hz</b>	<b>ECO 01</b> <b>ML 23.7Hz</b>	<b>ECO 01</b> <b>23.7Hz</b>
<b>15.3A</b>	<b>15.3A 6.9kW</b>	<b>15.3A 6.9kW</b>
		
Switching frequency is reduced, due to high heatsink temperature.	The incoming mains power supply has been disconnected or is missing.	The user programmable maintenance reminder time has elapsed.

### 5.4. Changing Parameters

Stop	ECO 01 <b>P1-01</b>	ECO 01 <b>P1-08</b>	ECO 01 <b>30.0A ▲</b>	ECO 01 <b>P1-08</b>	ECO 01 <b>Stop</b>
<b>15kW 400V 3Ph</b>	<b>50.0Hz</b>	<b>30.0A</b>	<b>P1-08 ↑30.0 ↓3.0</b>	<b>30.0A</b>	<b>15kW 400V 3Ph</b>
					
Press and hold the Navigate key > 2 seconds.	Use the Up and Down keys to select the required parameter. Display will show the present parameter value on the lower line of the display.	Press the Navigate key for < 1 second.	Adjust the value using the Up and Down keys. Display will show the maximum and minimum possible settings on the lower line of the display.	Press for < 1 second to return to the parameter menu.	Press for > 2 seconds to return to the operating display.

## 5.5. Parameter Factory Reset / User Reset

Optidrive Eco provides a feature to allow the user to define their own default parameter set. After commissioning all required parameters, the user can save these as the default parameters by setting P6-29 = 1. If required, the User Default Parameters may be cleared by setting P6-29 = 2.

If the user wishes to reload their own pre-saved 'User Defaults' parameters to the drive memory, then follow the procedure shown below.

<b>Factory Parameter Reset :</b>			<b>User Parameter Reset :</b>		
<b>ECO 01 Stop</b>	<b>ECO 01 P-Def</b>	<b>ECO 01 Stop</b>	<b>ECO 01 Stop</b>	<b>ECO 01 U-Def</b>	<b>ECO 01 Stop</b>
<b>15kW 400V 3Ph</b>	<b>50.0Hz</b>	<b>15kW 400V 3Ph</b>	<b>P1-08 ↑30.0 ↓3.0</b>	<b>30.0A</b>	<b>15kW 400V 3Ph</b>
					
Press and hold the Up, Down, Start and Stop keys for >2s.	The display shows P-def. Briefly press the Stop key.	The display returns to Stop. All parameters are reset to Factory defaults.	Press and hold the Up, Down and Stop keys for >2s.	The display shows U-def. Briefly press the Stop key.	The display returns to Stop. All parameters are reset to User Defaults.

**NOTE** If no User Default parameters have been saved in the drive, carrying out the User Parameter Reset procedure will return the drive to Factory Defaults.

## 5.6. Resetting the Drive Following a Trip

Optidrive Eco has many protection features, designed to protect both the drive and motor from accidental damage. When any of these protection features are activated, the drive will trip, and display a fault message. The fault messages are listed in section 12.1. Fault Messages on page 86.

When a trip occurs, after the cause of the trip has been investigated and rectified, the user can reset the trip in one of the following ways:

- Press the keypad Stop key.
- Power off the drive completely, then power on again.

**NOTE** Allow 30s after powering down the drive before re-applying power.

- If P1-13 > 0, switch off digital input 1, then back on again.
- If P1-12 = 4, reset via the fieldbus interface.
- If P1-12 = 6, reset via BACnet.

## 5.7. Selecting Between Hand and Auto Control

<b>A Stop</b>	<b>H Stop ▲</b>
<b>37kW 400V 3Ph</b>	<b>37kW 400V 3Ph</b>
A = Auto	H = Hand
	
The active control source is shown on the Display. Use the Hand and Auto buttons on the keypad to switch between control sources.	Hand mode permits drive control directly from the drive keypad. Auto mode control source is configured with Parameter P1-12 (Control Mode).

**NOTE** The use of the Hand and Auto buttons can be disabled by adjusting the setting of P2-39 Parameter Access Lock.

## 5.8. Keypad Shortcuts

The following shortcuts can be used to speed up selecting and changing parameters when using the keypad.

### 5.8.1. Selecting the Parameter Groups

When extended or advanced parameter access is enabled (see section 9. Extended Parameters on page 47), additional parameter groups are visible, and may be selected quickly by the following method.

Maximum frequency/Speed limit <b>P1-01</b>	Preset frequency/Speed 1 <b>P2-01</b>
50.0Hz	5.0Hz

Whilst in the parameter selection menu, press the Navigate and Up or Navigate and Down keys simultaneously.

### 5.8.2. Selecting the Lowest Parameter in a Group

Motor rated current <b>P1-08</b>	Maximum frequency/Speed limit <b>P1-01</b>
9.5A	50.0Hz

Whilst in the parameter selection menu, press the Up and Down keys simultaneously.

### 5.8.3. Setting a Parameter to the Minimum Value

Maximum frequency/Speed limit <b>1500 rpm</b>	Maximum frequency/Speed limit <b>0 rpm</b>
P1-01 ↑7500 rpm ↓0 rpm	P1-01 ↑7500 rpm ↓0 rpm

Whilst editing a parameter value, press the Up and Down keys simultaneously.

The parameter will be set to the lowest possible value.

### 5.8.4. Adjusting Individual Digits

When editing parameter values and making large changes, e.g. setting the motor rated speed from 0 to 1500 Rpm, it is possible to directly select the parameter digits using the following method.

Extended menu access <b>0</b>	Extended menu access <b>_0</b>	Extended menu access <b>_0</b>	Extended menu access <b>100</b>	Extended menu access <b>100</b>	Extended menu access <b>100</b>
P1-14 ↑30 000 ↓0	P1-14 ↑30 000 ↓0	P1-14 ↑30 000 ↓0	P1-14 ↑30 000 ↓0	P1-14 ↑30 000 ↓0	P1-14 ↑30 000 ↓0

Whilst editing a parameter value, press the Stop and Navigate keys simultaneously.

The cursor will step one digit to the left. Repeating the key press will move another digit to the left.

The individual digit value may be adjusted using the up and down keys.

Adjust the value using the Up and Down keys.

When the cursor reaches the highest accessible digit, pressing Stop and Navigate will return the cursor to the right most digit.

Press the Navigate key to return to the parameter selection menu.

# 6. Commissioning

## 6.1. General

The following guidelines apply to all applications:

### 6.1.1. Entering the Motor Nameplate Information

Optidrive Eco uses the information from the motor nameplate to:

- Operate the motor with the best possible efficiency level.
- Protect the motor against possible damage due to operation in overload condition.

In order to achieve this, the Optidrive requires that the following information from the motor nameplate is entered into the parameters:

**P1-07 Motor Rated Voltage.** This is the operating voltage for the motor in its present wiring configuration (Star or Delta). The maximum output voltage from the Optidrive can never exceed the incoming supply voltage.

**P1-08 Motor Rated Current.** This is the full load current of the motor from the nameplate.

**P1-09 Motor Rated Frequency.** This is the standard operating frequency of the motor, generally 50 or 60Hz.

**P1-10 Motor Rated Speed.** This parameter can optionally be set to the Rpm shown on the motor nameplate. When this parameter is entered, all speed related parameters in the drive are displayed in Rpm. When the parameter is set to zero, all speed related parameters are displayed in Hz.

### 6.1.2. Minimum and Maximum Frequencies / Speeds

Optidrive Eco units are factory set to operate the motor from zero up to base speed (50 or 60Hz output). In general, this operating range is suitable for a wide range of requirements, however in some cases it may be desired to adjust these limits, e.g. where the maximum speed of a fan or pump may provide excessive flow, or where operation below a certain speed is never required. In this case, the following parameters can be adjusted to suit the application:

**P1-01 Maximum Frequency.** In general this should match the motor rated frequency. If operation above this frequency is desired, confirmation from the motor manufacturer, and the manufacturer of any connected fan or pump should be sought that this is permissible, and will not cause damage to the equipment.

**P1-02 Minimum Frequency.** A suitable minimum can be set to prevent the motor operating at low speed, which may cause the motor to overheat. In some applications, such as a pump circulating water through a boiler, it may be necessary to set a speed to ensure the boiler does not run dry during operation.

### 6.1.3. Acceleration and Deceleration Ramp Times

Optidrive Eco units are factory set with acceleration and deceleration ramp rates set to 30 seconds. The default value is suitable for the majority of applications but can be altered by changing the values in parameters P1-03 and P1-04. Care must be taken to ensure the driven load is capable of performing the specified ramps and that nuisance trips due to excessively short ramp times are not produced.

The ramp times entered in the parameter set always specify the time taken to ramp between 0Hz and motor rated speed P1-09.

For example: If ramp rate = 30 seconds and P1-09 (motor base speed) = 50Hz, and assuming the motor is currently running at 25Hz and the drive is commanded to accelerate to 50Hz. The time taken to reach 50Hz would be 30 seconds ( $P1-03 / 50 (P1-09) * 25$  (required change in speed) = 15(s)).

**P1-03 Acceleration Ramp Rate:** Time taken for the drive to accelerate the motor from 0Hz to Motor base speed, P1-09 in seconds.

**P1-04 Deceleration Ramp Rate:** Time taken for the drive to decelerate the motor from Motor base speed, P1-09 to 0Hz in seconds.

### 6.1.4. Stop Mode Selection

Optidrive Eco units can be programmed to either apply a fixed deceleration to the motor during stopping, or to release control of the motor and allow it to coast or free-wheel to a stop. The default selection is for the drive is ramp to stop and behaviour is programmed using parameter P1-05.

**P1-05 Stop Mode Select:** Defines how the motor will be stopped in the event of the enable input being removed from the drive. Ramp to stop ( $P1-05 = 0$ ) will ramp the drive to stop using the value for deceleration entered in P1-04. Coast to stop ( $P1-05 = 1$ ) will allow the motor to coast to stop (uncontrolled).

### 6.1.5. Voltage Boost

Voltage boost is used to increase the applied motor voltage at low output frequencies, in order to improve low speed and starting torque. Excessive boost levels may result in increased motor current and temperature, and forced ventilation of the motor may be required.

The default value for Torque boost is set 0.0%, and this should only be increased if the starting torque is insufficient. Ensure that the correct Constant or Variable Torque mode is set in P4-01 before adjusting the boost.

**P1-11 Torque Boost:** Set as a percentage of motor rated voltage P1-07.

# 7. Parameters

## 7.1. Parameter Set Overview

The Optidrive Eco Extended Parameter set consists of 7 groups as follows:

- Group 1 – Basic Parameter Set
- Group 2 – Extended Parameter Set
- Group 3 – User PID Control Parameter Set
- Group 4 – Motor Control Parameters
- Group 5 – Field Bus Communications Parameter Set
- Group 8 – Application Specific Functions Parameter Set
- Group 0 – Monitoring and Diagnostic Parameters (Read Only).

When the Optidrive is reset to factory defaults, or is in its factory supplied state, only Group 1 Parameters can be accessed. In order to allow access to parameters from the higher level groups, P1-14 must be set to the same value as P2-40 (Default setting = 101). With this setting, parameter groups 1 – 5 and group 8 can be accessed, along with the first 39 parameters in Group 0. These parameters are listed in the tables below.

For advanced parameter access, P1-14 can be set to the same value as P6-30 (Default setting = 201), which allows access to all parameter groups and ranges. **Advanced parameter descriptions are listed in the advanced user guide.**

Values given in brackets () are default settings for horsepower rated drive models.

## 7.2. Parameter Group 1 – Basic Parameters

Par.	Parameter Name	Minimum	Maximum	Default	Units
P1-01	<b>Maximum Frequency/Speed Limit</b>	<b>P1-02</b>	<b>500.0</b>	<b>50.0 (60.0)</b>	<b>Hz / Rpm</b>
	Maximum output frequency or motor speed limit – Hz or Rpm. If P1-10 >0, the value entered / displayed is in Rpm. <b>NOTE</b> The maximum possible setting is limited to the lowest value of: <ul style="list-style-type: none"><li>▪ 5 x P1-09</li><li>▪ 5 x P1-10</li><li>▪ P2-24 / 16</li><li>▪ 500.0Hz</li></ul>				
P1-02	<b>Minimum Frequency/Speed Limit</b>	<b>0.0</b>	<b>P1-01</b>	<b>0.0</b>	<b>Hz / Rpm</b>
	Minimum speed limit – Hz or Rpm. If P1-10 >0, the value entered / displayed is in Rpm.				
P1-03	<b>Acceleration Ramp Time</b>	<b>0.0</b>	<b>6000.0</b>	<b>30.0</b>	<b>Seconds</b>
	Acceleration ramp time from 0 to base speed (P1-09) in seconds.				
P1-04	<b>Deceleration Ramp Time</b>	<b>0.0</b>	<b>6000.0</b>	<b>30.0</b>	<b>Seconds</b>
	Deceleration ramp time from base speed (P1-09) to standstill in seconds.				
P1-05	<b>Stop Mode</b>	<b>0</b>	<b>2</b>	<b>0</b>	<b>-</b>
	<b>0</b> Ramp	When the enable signal is removed, the drive will ramp to stop, with the rate controlled by P1-04 as described above.			
	<b>1</b> Coast	When the enable signal is removed the motor will coast (freewheel) to stop.			
	<b>2</b> AC Flux Braking	Provides additional braking torque capability when decelerating.			
P1-07	<b>Motor Rated Voltage / kE</b>	<b>0</b>	<b>Drive Rating Dependent</b>	<b>Volts</b>	
	<b>For Induction Motors</b> - Enter the rated (nameplate) voltage of the motor (Volts).				
	<b>For PM &amp; BLDC Motors</b> - Enter the back EMF at rated motor speed.				
P1-08	<b>Motor Rated Current</b>	<b>Drive Rating Dependent</b>	<b>100% drive rated current</b>	<b>Amps</b>	
	This parameter should be set to the rated (nameplate) current of the motor.				
P1-09	<b>Motor Rated Frequency</b>	<b>25</b>	<b>500</b>	<b>50 (60)</b>	<b>Hz</b>
	This parameter should be set to the rated (nameplate) current of the motor.				

Par.	Parameter Name	Minimum	Maximum	Default	Units
P1-10	<b>Motor Rated Speed</b>	0	30000	0	Rpm
	This parameter can optionally be set to the rated (nameplate) Rpm of the motor. When set to the default value of zero, all speed related parameters are displayed in Hz, and the slip compensation for the motor is disabled. Entering the value from the motor nameplate enables the slip compensation function, and the Optidrive display will now show motor speed in estimated Rpm. All speed related parameters, such as Minimum and Maximum Speed, Preset Speeds etc. will also be displayed in Rpm.				
P1-11	<b>Torque Boost</b>	0.0	0.0	Drive Rating Dependent	%
	Torque Boost is used to increase the applied motor voltage and hence current at low output frequencies. This can improve low speed and starting torque. Increasing the boost level will increase motor current at low speed, which may result in the motor temperature rising - forced ventilation of the motor may then be required. In general, the lower the motor power, the higher the boost setting that may be safely used. For IM motors, a suitable setting can usually be found by operating the motor under very low or no load conditions at approximately 5Hz, and adjusting P1-11 until the motor current is approximately the magnetising current. This parameter is also effective when using alternative motor types, P4-01 = 3, 4 or 5. In this case, the boost current level is defined as $4 \times P1-11 \times P1-08$ .				
P1-12	<b>Primary Command Source</b>	0	6	0	-
	0 <b>Terminal Control</b>	The drive responds directly to signals applied to the control terminals.			
	1 <b>Keypad control - uni-directional</b>	The drive can be controlled in the forward direction only using an internal or remote Keypad.			
	2 <b>Keypad control - uni-directional</b>	As above.			
	3 <b>PID Control</b>	The output frequency is controlled by the internal PID controller.			
	4 <b>Fieldbus Control</b>	By the selected Fieldbus (Group 5 Parameters) – Excludes BACnet (see option 6).			
	5 <b>Slave Mode</b>	The drive acts as a Slave to a connected Optidrive operating in Master Mode.			
	6 <b>BACNet MS/TP Mode</b>	Drive communicates / responds as a slave within a BACnet network.			
P1-13	<b>Digital Input Function</b>	0	14	1	-
	Defines the function of the digital inputs. When set to 0 the inputs are user defined using group 9 parameters or the PLC software function in the OptiTools Studio software package. When set to a value other than 0 the digital input configuration is defined by digital input definition table (see section 8.1. Digital Input Configuration Parameter P1-13 on page 44).				
P1-14	<b>Extended Menu Access</b>	0	30000	0	-
	Parameter Access Control. The following settings are applicable: P1-14 <> P2-40 and P1-14 <> P6-30: Allows access to Parameter Group 1 only. P1-14 = P2-40 (101 default): Allows access to Parameter Groups 0 - 5 and group 8. P1-14 = P6-30 (201 default): Allows access to Parameter Groups 0 - 9.				

# 8. Control Terminal Functions

## 8.1. Digital Input Configuration Parameter P1-13

P1-13 *(2)	Local (Hand) Control Function	Digital Input 1 (Terminal 2)	Digital Input 2 (Terminal 3)	Digital Input 3 (Terminal 4)	Analog Input 1 (Terminal 6)	Analog Input 2 (Terminal 10)	Notes

### Notes

\*(1): Logic shown is as per the default setting. Fire mode logic can be configured through parameter P8-09.

\*(2): Default setting for P1-13 = 1.

\*(3): When the drive is in PID control (P1-12 = 3) and digital preset reference is selected (P3-05 = 0) then P1-13 can be set to 1, 9, or 10 to allow selection between two independent digital references using digital input 2. Digital preset reference 1 and 2 are set in P3-06 and P3-15 respectively.

**NOTE** "Motor thermistor trip" connection is via analog input 2 and is configured by parameter P2-33 (P<sub>tc-tb</sub>).

## 8.2. Macro Function Guide

Function	Explanation
STOP	Latched Input, Open the contact to STOP the drive.
RUN	Latched input, Close the contact to Start, the drive will operate as long as the input is maintained.
FWD	Latched Input, selects the direction of motor rotation FORWARD.
REV	Latched Input, selects the direction of motor rotation REVERSE.
RUN FWD	Latched Input, Close to Run in the FORWARD direction, Open to STOP.
RUN REV	Latched Input, Close to Run in the REVERSE direction, Open to STOP.
ENABLE	Hardware Enable Input. In Keypad Mode, P2-37 determines whether the drive immediately starts, or the keypad start key must be pressed. In other modes, this input must be present before the start command is applied via the fieldbus interface.
START↑	Normally Open, Rising Edge, Close momentarily to START the drive (NC STOP Input must be maintained).
^- START -^	Simultaneously applying both inputs momentarily will START the drive (NC STOP Input must be maintained).
STOP↓	Normally Closed, Falling Edge, Open momentarily to STOP the drive.
START↑FWD	Normally Open, Rising Edge, Close momentarily to START the drive in the forward direction (NC STOP Input must be maintained).
START↑REV	Normally Open, Rising Edge, Close momentarily to START the drive in the reverse direction (NC STOP Input must be maintained).
^-FAST STOP (P2-25)-^	When both inputs are momentarily active simultaneously, the drive stops using Fast Stop Ramp Time P2-25.
FAST STOP↓ (P2-25)	Normally Closed, Falling Edge, Open momentarily to FAST STOP the drive using Fast Stop Ramp Time P2-25.
E-TRIP	Normally Closed, External Trip input. When the input opens momentarily, the drive trips showing <i>E-Trip IP</i> or <i>Ptc-th</i> depending on P2-33 setting. See section 4.8.2. Motor Thermistor Connection on page 30 for further information.
Analog Input AI1	Analog Input 1, signal format selected using P2-30.
Analog Input AI2	Analog Input 2, signal format selected using P2-33.
AI1 REF	Analog Input 1 provides the speed reference.
AI2 REF	Analog Input 2 provides the speed reference.
P2-OX REF	Speed reference from the selected preset speed.
PR-REF	Preset speeds P2-01 – P2-08 are used for the speed reference, selected according to other digital input status.
PI-REF	PI Control Speed Reference.
PI FB	Analog Input used to provide a Feedback signal to the internal PI controller.
KPD REF	Keypad Speed Reference selected.
INC SPD↑	Normally Open, Close the input to Increase the motor speed.
DEC SPD↓	Normally Open, Close input to Decrease motor speed.
FB REF	Selected speed reference from Fieldbus (Modbus RTU / CAN Open / Master depending on P1-12 setting).
(NO)	Input is Normally Open, Close momentarily to activate the function.
(NC)	Input is Normally Closed, Open momentarily to activate the function.
DECEL P1-04	During deceleration and stopping, Deceleration Ramp 1 (P1-04) is used.
DECEL P8-11	During deceleration and stopping, Deceleration Ramp 2 (P8-11) is used (Requires Advanced Parameter Access, see section 7.1. Parameter Set Overview on page 42).

### 8.3. Example Connection Schematics

# 9. Extended Parameters

## 9.1. Parameter Group 2 – Extended Parameters

Par.	Parameter Name	Minimum	Maximum	Default	Units
P2-01	<b>Preset Frequency / Speed 1</b>	-P1-01	P1-01	50.0 (60.0)	Hz / Rpm
P2-02	<b>Preset Frequency / Speed 2</b>	-P1-01	P1-01	40.0	Hz / Rpm
P2-03	<b>Preset Frequency / Speed 3</b>	-P1-01	P1-01	25.0	Hz / Rpm
P2-04	<b>Preset Frequency / Speed 4</b>	-P1-01	P1-01	P1-01	Hz / Rpm
	Preset speeds can be selected by:				
	▪ Configuring P1-13 to an option that permits logic selection via the digital inputs (see section 8.1. Digital Input Configuration Parameter P1-13 on page 44).				
	▪ Using the user defined logic configuration parameters in Parameter Group 9.				
	▪ Configured through the drive PLC function using the OptiTools Studio PC software.				
P2-05	<b>Preset Speed 5 / Clean 1</b>	-P1-01	P1-01	0.0	Hz / Rpm
	Preset speed 5 is automatically referenced by the Pump Clean function when this is enabled. When the Pump Clean function is disabled, Preset speed 5 can be selected as per preset speeds 1 – 4.				
P2-06	<b>Preset Speed 6 / Clean 2</b>	-P1-01	P1-01	0.0	Hz / Rpm
	Preset speed 6 is automatically referenced by the Pump Clean function when this is enabled. When the Pump Clean function is disabled Preset speed 6 can be selected as per preset speeds 1 – 4.				
P2-07	<b>Preset Speed 7 / Boost 1 / Pump Stir Speed</b>	-P1-01	P1-01	0.0	Hz / Rpm
	Preset speed 7 is automatically referenced by the Start / Stop Boost function, or the Pump Stir Function, when these functions are enabled. When they are disabled, Preset speed 7 can be selected as per preset speeds 1 – 4.				
P2-08	<b>Preset Speed 8 / Boost 2</b>	-P1-01	P1-01	0.0	Hz / Rpm
	Preset speed 8 is automatically referenced by the Start / Stop Boost function when this function is enabled. When disabled, Preset speed 8 can be selected as per preset speeds 1 – 4.				
P2-09	<b>Skip Frequency Centre Point</b>	P1-02	P1-01	0.0	Hz / Rpm
	Defines the centre point of the skip frequency band. The width of the skip frequency band is defined by:				
	▪ Lower limit = P2-09 - P2-10/2				
	▪ Upper limit = P2-09 + P2-10/2				
	All skip frequency bands defined for forward speeds are mirrored for negative speeds.				
P2-10	<b>Skip Frequency Band Width</b>	0.0	P1-01	0.0	Hz / Rpm
	Defines the width of the skip frequency band. The width of the skip frequency band is defined by:				
	▪ Lower limit = P2-09 - P2-10/2				
	▪ Upper limit = P2-09 + P2-10/2				
	All skip frequency bands defined for forward speeds are mirrored for negative speeds.				
P2-11	<b>Analog Output 1 Function</b>	0	12	8	-
	<b>Digital Output Mode. Logic 1 = +24V DC</b>				
0	<b>Drive running</b>	Logic 1 when the Optidrive is enabled (Running).			
1	<b>Drive healthy</b>	Logic 1 When no Fault condition exists on the drive.			
2	<b>At speed</b>	Logic 1 when the output frequency matches the setpoint frequency.			
3	<b>Motor speed &gt; 0</b>	Logic 1 when the motor runs above zero speed.			
4	<b>Motor speed &gt;= limit</b>	Logic 1 when the motor speed exceeds the adjustable limit.			
5	<b>Motor current &gt;= limit</b>	Logic 1 when the motor current exceeds the adjustable limit.			
6	<b>Motor torque &gt;= Limit</b>	Logic when the motor torque exceeds the adjustable limit.			
7	<b>Analog input 2 &gt;=limit</b>	Logic when the signal applied to the Analog Input 2 exceeds the adjustable limit.			
	<b>Analog Output Mode</b>				
8	<b>Motor speed</b>	0 to P1-01.			
9	<b>Motor current</b>	0 to 200% of P1-08.			
10	<b>Motor torque</b>	0 to 200% of motor rated torque.			
11	<b>Motor power</b>	0 to 150% of drive rated power.			
12	<b>PID Output</b>	Output from the internal PID Controller, 0 – 100%.			

Par.	Parameter Name	Minimum	Maximum	Default	Units
P2-12	<b>Analog Output 1 Format</b>	-	-	U 0-10	-
	U 0-10 = 0 to 10V				
	U 10-0 = 10 to 0V				
	A 0-20 = 0 to 20mA				
	A 20-0 = 20 to 0mA				
	A 4-20 = 4 to 20mA				
	A 20-4 = 20 to 4mA				
P2-13	<b>Analog Output 2 Function</b>	0	12	9	-
	<b>Digital Output Mode. Logic 1 = +24V DC</b>				
0	<b>Drive running</b>	Logic 1 when the Optidrive is enabled (Running).			
1	<b>Drive healthy</b>	Logic 1 When no Fault condition exists on the drive.			
2	<b>At speed</b>	Logic 1 when the output frequency matches the setpoint frequency.			
3	<b>Motor speed &gt; 0</b>	Logic 1 when the motor runs above zero speed.			
4	<b>Motor speed &gt;= limit</b>	Logic 1 when the motor speed exceeds the adjustable limit.			
5	<b>Motor current &gt;= limit</b>	Logic 1 when the motor current exceeds the adjustable limit.			
6	<b>Motor torque &gt;= limit</b>	Logic when the motor torque exceeds the adjustable limit.			
7	<b>Analog input 2 &gt;= limit</b>	Logic when the signal applied to the Analog Input 2 exceeds the adjustable limit.			
	<b>NOTE</b> When using settings 4 – 7, parameters P2-19 and P2-20 must be used together to control the behaviour. The output will switch to Logic 1 when the selected signal exceeds the value programmed in P2-19, and return to Logic 0 when the signal falls below the value programmed in P2-20.				
	<b>Analog Output Mode</b>				
8	<b>Motor speed</b>	0 to P1-01.			
9	<b>Motor current</b>	0 to 200% of P1-08.			
10	<b>Motor torque</b>	0 to 200% of motor rated torque.			
11	<b>Motor power</b>	0 to 150% of drive rated power.			
12	<b>PID output</b>	Output from the internal PID Controller, 0 – 100%.			
P2-14	<b>Analog Output 2 Format</b>	-	-	U 0-10	-
	0-10 = 0 to 10V				
	0-0 = 10 to 0V				
	A 0-20 = 0 to 20mA				
	A 20-0 = 20 to 0mA				
	A 4-20 = 4 to 20mA				
	A 20-4 = 20 to 4mA				

Par.	Parameter Name	Minimum	Maximum	Default	Units
P2-15	<b>Relay 1 Function</b>	0	15	1	-
	Selects the function assigned to Relay Output 1. The relay has normally open and normally closed contacts. Logic 1 indicates the relay is active, and therefore the normally open contact is closed (terminals 14 and 15 will be linked together) and the normally closed contact is opened (terminals 14 and 16 will no longer be connected together).				
	Settings 4, 5, 6, 7 & 14 use the adjustable limit parameters P2-16 and P2-17. The Output switches to Logic 1 (relay closed) when the chosen analog value exceeds the Upper Threshold (P2-16) and resets to Logic 0 (relay open) when the chosen analog value reduces below the Lower Threshold (P2-17).				
	<b>0 : Drive running.</b> Logic 1 when the motor is enabled.				
	<b>1 : Drive healthy.</b> Logic 1 when power is applied to the drive and no fault exists.				
	<b>2 : At speed.</b> Logic 1 when the output frequency matches the set-point frequency.				
	<b>3 : Motor speed &gt; 0.</b> Logic 1 when the drive output frequency to the motor exceeds 0.0Hz.				
	<b>4 : Motor speed &gt;= limit.</b> Logic 1 when the motor speed exceeds the adjustable limit.				
	<b>5 : Motor current &gt;=limit.</b> Logic 1 when the motor current exceeds the adjustable limit.				
	<b>6 : Motor Torque &gt;=limit.</b> Logic when the motor torque exceeds the adjustable limit.				
	<b>7 : Analog input 2 &gt;=limit.</b> Logic 1 when the signal applied to the Analog Input 2 exceeds the adjustable limit.				
	<b>8 : Reserved.</b> No Function.				
	<b>9 : Fire mode active.</b> Logic 1 when the drive in running in Fire Mode (Fire Mode input is active).				
	<b>10 : Maintenance due.</b> Logic 1 when Maintenance Timer expires indicating that Maintenance is now due.				
	<b>11 : Drive ready to run.</b> Logic 1 when drive is in Auto-mode, no trips are present, and the safety circuit is enabled indicating that drive is ready for automatic control.				
	<b>12 : Drive tripped.</b> Logic 1 when the drive has tripped and the display shows the fault code.				
	<b>13 : STO Status.</b> Logic 1 when both Hardware Enable (STO) inputs are present and the drive is able to be operated.				
	<b>14 : PID error &gt;=limit.</b> The PID Error (difference between setpoint and feedback) is greater than or equal to the programmed limit.				
	<b>15 : Low &amp; high current warning.</b> Logic 1 when the load monitoring has been enabled using P8-06 to P8-08 and a high load or low load condition has been detected – usually used to signal pump blockage or burst pipe.				
P2-16	<b>Relay 1 / AO1 Upper Limit</b>	P2-17	200.0	100.0	%
	Sets the upper limited value for P2-11 and P2-15, please refer to P2-11 or P2-15.				
P2-17	<b>Relay 1 / AO1 Lower Limit</b>	0	P2-16	0.0	%
	Sets the lower limited value for P2-11 and P2-15, please refer to P2-11 or P2-15.				
P2-18	<b>Relay 2 Function</b>	0	15	0	-
	Selects the function assigned to Relay Output 2. The relay has two output terminals, Logic 1 indicates the relay is active, and therefore terminals 17 and 18 will be linked together.				
	Settings 4, 5, 6, 7 & 14 use the adjustable limit parameters P2-19 and P2-20. The Output switches to Logic 1 (relay closed) when the chosen analog value exceeds the Upper Threshold (P2-19) and resets to Logic 0 (relay open) when the chosen analog value reduces below the Lower Threshold (P2-20).				
	<b>0 : Drive running.</b> Logic 1 when the motor is enabled.				
	<b>1 : Drive healthy.</b> Logic 1 when power is applied to the drive and no fault exists.				
	<b>2 : At speed.</b> Logic 1 when the output frequency matches the set-point frequency.				
	<b>3 : Motor speed &gt; 0.</b> Logic 1 when the drive output frequency to the motor exceeds 0.0Hz.				
	<b>4 : Motor speed &gt;= limit.</b> Logic 1 when the motor speed exceeds the adjustable limit.				
	<b>5 : Motor current &gt;=limit.</b> Logic 1 when the motor current exceeds the adjustable limit.				
	<b>6 : Motor torque &gt;= limit.</b> Logic 1 when the motor torque exceeds the adjustable limit.				
	<b>7 : Analog input 2 &gt;=limit.</b> 1 Logic when the signal applied to the Analog Input 2 exceeds the adjustable limit.				
	<b>8 : Assist pump 1 control (DOL*).</b> Contact your local sales partner for detailed instructions for DOL Cascade operation.				
	<b>9 : Fire mode active.</b> Logic 1 when the drive in running in Fire Mode (Fire Mode input is active).				
	<b>10 : Maintenance due.</b> Logic 1 when Maintenance Timer expires indicating that Maintenance is now due.				
	<b>11 : Drive ready to run.</b> Logic 1 when drive is in Auto-mode, no trips are present, and the safety circuit is enabled indicating that drive is ready for automatic control.				
	<b>12 : Drive tripped.</b> Logic 1 when the drive has tripped and the display shows the fault code.				
	<b>13 : STO status.</b> Logic 1 when both Hardware Enable (STO) inputs are present and the drive is able to be operated.				
	<b>14 : PID error &gt;=limit.</b> The PID Error (difference between setpoint and feedback) is greater than or equal to the programmed limit.				
	<b>15 : Low &amp; high current warning.</b> Logic 1 when the load monitoring has been enabled using P8-06 to P8-08 and a high load or low load condition has been detected – usually used to signal pump blockage or burst pipe.				
P2-19	<b>Relay 2 / AO2 Upper Limit</b>	P2-20	200.0	100.0	%
	Sets the upper limited value for P2-13 and P2-18, please refer to P2-13 or P2-18.				

Par.	Parameter Name	Minimum	Maximum	Default	Units
P2-20	<b>Relay 2 / AO2 Lower Limit</b>	0.0	P2-19	0.0	%
	Sets the lower limited value for P2-13 and P2-18, please refer to P2-13 or P2-18.				
P2-21	<b>Display Scaling Factor</b>	-30.000	30.000	0.000	-
	Determines the factor for the scaled display value. The variable selected in P2-22 is scaled by the factor set in P2-21.				
P2-22	<b>Display Scaling Source</b>	0	3	0	-
	Source value used when custom units are to be shown on the drive display. <b>0 : Motor Speed</b> <b>1 : Motor Current</b> <b>2 : Analog Input 2</b> <b>3 : PO-80 Value</b>				
	<b>NOTE</b> P2-21 & P2-22 allow the user to program the Optidrive display to show an alternative output unit scaled from an existing parameter (for example, to display conveyer speed in metres per second based on the output frequency). This function is disabled if P2-21 is set to 0. If P2-21 is set >0, the variable selected in P2-22 is multiplied by the factor entered in P2-21, and is shown on the drive display whilst the drive is running.				
P2-23	<b>Zero Speed Holding Time</b>	0.0	60.0	0.2	Seconds
	Determines the time for which the drive output frequency is held at zero when stopping, before the drive output is disabled.				
P2-24	<b>Effective Switching Frequency</b>	<b>Drive Rating Dependent</b>			kHz
	Effective power stage switching frequency. Higher frequencies reduce audible noise from the motor, and improve the output current waveform, at the expense of increased drive losses. <b>NOTE</b> De-rating of the drive output current may be required when increasing P2-24 beyond the minimum setting. Refer to section 11.7.3. Derating for Switching Frequency on page 84 for further information.				
P2-25	<b>Fast Decel Ramp Time</b>	0.00	240.0	0.0	Seconds
	This parameter allows an alternative deceleration ramp down time to be programmed into the Optidrive. Fast Deceleration ramp is selected Automatically in the case of a mains power loss if P2-38 = 2. When ramp rate in P2-25 is set to 0.0, the drive will coast to stop. Fast deceleration ramp can also be selected using the user defined logic configuration parameters in menu 9 (P9-02), or selection configured through the drive PLC function using the OptiTools Studio PC software. In addition, if P2-25 > 0, P1-02 > 0, P2-10 = 0 and P2-09 = P1-02, this ramp time is applied to both acceleration and deceleration when operating below minimum speed, allowing selection of an alternative ramp when operating outside of the normal speed range, which may be useful in pump and compressor applications.				
P2-26	<b>Spin Start Enable</b>	0	2	1	-
	When Enabled, the drive will attempt to determine if the motor is already rotating on start up, and to detect rotational speed and direction. The drive will begin control of the motor from its present (detected) speed. A short delay may be observed when starting the drive whilst the spin start function is completed. <b>0 : Disabled</b> <b>1 : Enabled</b> <b>2 : Enabled following Trip, Brown Out or Coast Stop</b>				
P2-27	<b>Standby Mode Timer</b>	0.0	250.0	20	Seconds
	This parameter defines the time period, whereby if the drive operates at the frequency / speed set in P3-14 (Standby speed threshold) for greater than the set time period, the Optidrive output will be disabled, and the display will show <b>Standby</b> . The function is disabled if P2-27 = 0.0.				
P2-28	<b>Slave Speed Scaling Control</b>	0	3	0	-
	Active in Keypad mode (P1-12 = 1 or 2) and Slave mode (P1-12=5) only. The keypad reference can be multiplied by a preset scaling factor or adjusted using an analog trim or offset. <b>0 : Disabled.</b> No scaling or offset is applied. <b>1 : Actual Speed = Digital Speed x P2-29</b> <b>2 : Actual Speed = (Digital Speed x P2-29) + Analog Input 1 Reference</b> <b>3 : Actual Speed = (Digital Speed x P2-29) x Analog Input 1 Reference</b>				
P2-29	<b>Slave Speed Scaling Factor</b>	-500.0	500.0	%	100.0
	Slave speed scaling factor used in conjunction with P2-28.				

Par.	Parameter Name	Minimum	Maximum	Default	Units
P2-30	<b>Analog Input 1 Format</b>	See Below	U 0-10	-	
	U 0-10 = 0 to 10 Volt Signal (Uni-polar). U 10-0 = 10 to 0 Volt Signal (Uni-polar). -10-10 = -10 to +10 Volt Signal (Bi-polar). A 0-20 = 0 to 20mA Signal. E 4-20 = 4 to 20mA Signal, the Optidrive will trip and show the fault code <b>4-20F</b> if the signal level falls below 3mA. r 4-20 = 4 to 20mA Signal, the Optidrive will ramp to preset speed 4 (P2-04) if the signal level falls below 3mA. E 20-4 = 20 to 4mA Signal, the Optidrive will trip and show the fault code <b>4-20F</b> if the signal level falls below 3mA. r 20-4 = 20 to 4mA Signal, the Optidrive will ramp to preset speed 4 (P2-04) if the signal level falls below 3mA.				
P2-31	<b>Analog Input 1 Scaling</b>	0.0	2000.0	100.0	%
	P2-31 is used to scale the analog input prior to being applied as a reference to the drive. For example, if P2-30 is set for 0 – 10V, and the scaling factor is set to 200.0%, a 5 volt input will result in the drive running at maximum speed (P1-01).				
P2-32	<b>Analog Input 1 Offset</b>	-500.0	500.0	0.0	%
	P2-32 defines an offset for the analog input, as a percentage of the full range of the input. A positive offset is deducted from the incoming analog signal and a negative offset is added to the signal. For example, if P2-30 is set for 0 – 10V, and the analog offset is set to 10.0%, then 1 volt (10% of 10V) will be deducted from the incoming analog reference prior to it being applied.				
P2-33	<b>Analog Input 2 Format</b>	See Below	U 0-10	-	
	U 0-10 = 0 to 10 Volt Signal (Uni-polar). U 10-0 = 10 to 0 Volt Signal (Uni-polar). Ptc-Erh = Motor PTC Thermistor Input. A 0-20 = 0 to 20mA Signal. E 4-20 = 4 to 20mA Signal, the Optidrive will trip and show the fault code <b>4-20F</b> if the signal level falls below 3mA. r 4-20 = 4 to 20mA Signal, the Optidrive will ramp to preset speed 4 (P2-04) if the signal level falls below 3mA. E 20-4 = 20 to 4mA Signal, the Optidrive will trip and show the fault code <b>4-20F</b> if the signal level falls below 3mA. r 20-4 = 20 to 4mA Signal, the Optidrive will ramp to preset speed 4 (P2-04) if the signal level falls below 3mA.				
P2-34	<b>Analog Input 2 Scaling</b>	0.0	2000.0	100.0	%
	P2-34 is used to scale the analog input prior to being applied as a reference to the drive. For example, if P2-34 is set for 0 – 10V, and the scaling factor is set to 200.0%, a 5 volt input will result in the drive running at maximum speed (P1-01).				
P2-35	<b>Analog Input 2 Offset</b>	-500.0	500.0	0.0	%
	P2-35 defines an offset for the analog input, as a percentage of the full range of the input. A positive offset is deducted from the incoming analog signal and a negative offset is added to the signal. For example, if P2-33 is set for 0 – 10V, and the analog offset is set to 10.0%, then 1 volt (10% of 10V) will be deducted from the incoming analog reference prior to it being applied.				
P2-36	<b>Start Mode Select / Automatic Restart</b>	See Below	Ed9E-r	-	
	Defines the behaviour of the drive relating to the enable digital input and also configures the Automatic Restart function. <b>Ed9E-r</b> : Following Power on or reset, the drive will not start if Digital Input 1 remains closed. The Input must be closed after a power on or reset to start the drive. <b>AUto-0</b> : Following a Power On or Reset, the drive will automatically start if Digital Input 1 is closed. <b>AUto-1 to AUto-5</b> : Following a trip, the drive will make up to 5 attempts to restart at 20 second intervals. The drive must be powered down to reset the counter. The number of restart attempts are counted, and if the drive fails to start on the final attempt, the drive will remain in the fault condition with the last active trip code, and will require the user to manually reset the fault.				
	<b>DANGER! "AUto" modes allow the drive to Auto-start, therefore the impact on system/Personnel safety needs to be considered.</b>				

Par.	Parameter Name	Minimum	Maximum	Default	Units
P2-37	<b>Keypad Start Mode</b>	<b>0</b>	<b>7</b>	<b>2</b>	-
	Options 0 to 3 are only active when P1-12 = 1 or 2 (keypad Mode). With these settings, the drive waits for the keypad start button to be pressed before running.				
	<b>0 : Minimum speed, keypad start.</b> Following a stop and restart, the drive will always initially run at the minimum speed P1-02.				
	<b>1 : Previous speed, keypad start.</b> Following a stop and restart, the drive will return to the last keypad set-point speed used prior to stopping.				
	<b>2 : Current speed, keypad start.</b> Where the Optidrive is configured for multiple speed references (typically Hand / Auto control or Local / Remote control), when switched to keypad mode by a digital input, the drive will continue to operate at the last operating speed.				
	<b>3 : Preset speed 4, keypad start.</b> Following a stop and restart, the Optidrive will always initially run at Preset Speed 4 (P2-04).				
	Options 4 to 7 are active in all control modes. Drive starting in these modes is controlled by the enable digital input on the control terminals.				
	<b>4 : Minimum speed, terminal start.</b> Following a stop and restart, the drive will always initially run at the minimum speed P1-02.				
	<b>5 : Previous speed, terminal start.</b> Following a stop and restart, the drive will return to the last keypad set-point speed used prior to stopping.				
	<b>6 : Current speed, terminal start.</b> Where the Optidrive is configured for multiple speed references (typically Hand / Auto control or Local / Remote control), when switched to keypad mode by a digital input, the drive will continue to operate at the last operating speed.				
	<b>7 : Preset speed 4, terminal start.</b> Following a stop and restart, the Optidrive will always initially run at Preset Speed 4 (P2-04).				
P2-38	<b>Mains Loss Stop / Ride Through</b>	<b>0</b>	<b>3</b>	<b>0</b>	-
	Controls the behaviour of the drive in response to a loss of mains power supply whilst the drive is enabled.				
	<b>0 : Reserved.</b>				
	<b>1 : Coast to stop.</b> The Optidrive will immediately disable the output to the motor, allowing the load to coast or free wheel. When using this setting with high inertia loads, the Spin Start function (P2-26) may need to be enabled.				
	<b>2 : Fast ramp to stop.</b> The drive will ramp to stop at the rate programmed in the Fast deceleration time P2-25. NA Coast to stop is the only applicable action on mains loss in the Eco.				
	<b>3 : DC bus supply.</b> NA Coast to stop is the only applicable action on mains loss in the Eco				
P2-39	<b>Parameter Lock</b>	<b>0</b>	<b>1</b>	<b>0</b>	-
	<b>0 : Unlocked.</b> All parameters can be accessed and changed				
	<b>1 : Locked.</b> Parameter values can be displayed, but cannot be changed. Also disables Hand and Auto button on keypad.				
P2-40	<b>Extended Menu Access Code</b>	<b>0</b>	<b>9999</b>	<b>101</b>	-
	Defines the access code which must be entered in P1-14 to access parameter groups above Group 1.				

## 9.2. Parameter Group 3 – PID Control

### 9.2.1. Overview

Optidrive Eco provides an internal PID controller. Parameters for configuration of the PID controller are located together in Group 3. For simple applications, the user needs to only define the setpoint source (P3-05 to select the source or P3-06 for a fixed setpoint), feedback source (P3-10) and adjust the P Gain (P3-01), I time (P3-02) and optionally the differential time (P3-03).

The PID operation is uni-directional, and all signals are treated as 0 – 100% to provide a simple, intuitive operating format.

### 9.2.2. Parameter List

Par.	Parameter Name	Minimum	Maximum	Default	Units
P3-01	<b>PID Proportional Gain</b>	0.1	30.0	1.0	-
	PID Controller Proportional Gain. Instantaneous error between the feedback and the set-point in the PID controller is multiplied by P3-01 to produce the output from the PID controller. Higher values of proportional gain produce a larger change in the drive output frequency in response to changes in the PID set-point or feedback signals. Too high a value can cause instability.				
P3-02	<b>PID Integral Time</b>	0.0	30.0	1.0	Seconds
	PID Controller Integral Time. Accumulated error in the PID control. Uses accumulated errors between set-point and feedback signals to influence the output from the PID controller. P3-02 is the time constant for accumulating error. Larger values provide a more damped response. Lower values result in a faster system response but may result in instability.				
P3-03	<b>PID Differential Time</b>	0.00	1.00	0.00	Seconds
	PID Differential Time Constant. The Differential time constant references the rate of change of the feedback signal over time and works to slow the rate of change of the PID controller, particularly as it approaches the set-point. Setting a shorter time will decrease overshoot but slow down response and may lead to instability.				
	<b>NOTE</b> P3-03 is set to 0 by default which disables the differential time constant. Care must be taken when adjusting this value outside of its default value.				
P3-04	<b>PID Operating Mode</b>	0	1	0	-
	<b>0 : Direct operation.</b> Use this mode if an increase in the feedback signal should result in a decrease in the motor speed.				
	<b>1 : Inverse operation.</b> Use this mode if an increase in the feedback signal should result in an increase in the motor speed.				
P3-05	<b>PID Reference Select</b>	0	2	0	-
	Selects the source for the PID Reference / Set-point.				
	<b>0 : Digital preset.</b> P3-06 is used.				
	<b>1 : Analog input 1</b>				
	<b>2 : Analog input 2</b>				
P3-06	<b>PID Digital Reference Value</b>	0.0	100.0	0.0	%
	When P3-05 = 0, this parameter sets the preset digital reference (set-point) used for the PID Controller.				
P3-07	<b>PID Output Upper Limit</b>	P3-08	100.0	100.0	%
	Limits the maximum value output from the PID controller.				
P3-08	<b>PID Output Lower Limit</b>	0.0	P3-07	0.0	%
	Limits the minimum output from the PID controller.				
P3-09	<b>PID Output Limit Select</b>	0	3	0	-
	<b>0 : Digital output limits.</b> The output range of the PID controller is limited by the values of P3-07 & P3-08.				
	<b>1 : Upper limit set by analog input 1.</b> The output range of the PID controller is limited by the values of P3-08 & the signal applied to Analog Input 1.				
	<b>2 : Lower limit set by analog input 1.</b> The output range of the PID controller is limited by the signal applied to Analog Input 1 & the value of P3-07.				
	<b>3 : PID output added to analog input 1.</b> The output value from the PID Controller is added to the speed reference applied to the Analog Input 1.				
P3-10	<b>PID Feedback Select</b>	0	5	0	-
	Defines the source of the PID control feedback (location of the feedback sensor).				
	<b>0 : Analog input 2.</b> 0 – 100.0%.				
	<b>1 : Analog input 1.</b> 0 – 100.0%.				
	<b>2 : Motor current.</b> 0 – 100.0% of P1-08 Value.				
	<b>3 : DC bus voltage.</b> 0 – 1000 Volt = 0 – 100.0%.				
	<b>4 : Analog input 1 – Analog input 2.</b> Differential of Analog 1 – Analog 2 = 0 – 100.0%.				
	<b>5 : Largest (analog input 1, analog input 2).</b> The greater of Analog input 1 or Analog Input 2 is always used.				

Par.	Parameter Name	Minimum	Maximum	Default	Units
P3-11	<b>PID Error to Enable Ramp</b>	<b>0.0</b>	<b>25.0</b>	<b>0.0</b>	%
	Defines a threshold PID error level, whereby if the difference between the set-point and feedback value is less than the set threshold, the internal ramp times of the drive are disabled to allow the drive to react quickly to small errors. Where a greater PID error exists, the ramp times are enabled to limit the rate of change of motor speed.				
	Setting to 0.0 means that the drive ramps are always enabled. This parameter is intended to allow the user to disable the drive internal ramps where a fast reaction to the PID control is required, however by only disabling the ramps when a small PID error exists, the risk of possible over current or over voltage trips being generated is reduced.				
P3-12	<b>PID Feedback Display Scaling</b>	<b>0.000</b>	<b>50.000</b>	<b>0.000</b>	-
	Applies a scaling factor to the displayed PID feedback, allowing the user to display the actual signal level from a transducer, e.g. 0 – 10 Bar etc.				
P3-13	<b>PID Error Wake Level</b>	<b>0.0</b>	<b>100.0</b>	<b>5.0</b>	%
	Sets a programmable PID Error Level whereby if the drive enters standby mode whilst operating under PID control, the difference between the PID reference and PID feedback signals must exceed this error level to restart the PID controller.				
P3-14	<b>Standby Speed Threshold</b>	<b>0.0</b>	<b>P1-01</b>	<b>0.0</b>	<b>Hz / Rpm</b>
	Determines the level at which the drive will enter into standby mode. P2-27 must be set with a value (time) for standby function to be active. Drive enters standby mode if motor speed remains below the level set in P3-14 for the time period set in P2-27.				
P3-15	<b>PID Reference 2 Value</b>	<b>0.0</b>	<b>100.0</b>	<b>0.0</b>	%
	When P3-05 = 0, and the 2nd digital reference is selected (see section 8.1. Digital Input Configuration Parameter P1-13) this parameter sets the preset digital reference (set-point) used for the PID Controller.				
P3-16	<b>Pump Prime Time</b>	<b>0</b>	<b>2000</b>	<b>0</b>	<b>Seconds</b>
	A value other than zero in this parameter will automatically enable the burst pipe detection function. Each time the drive is enabled whilst in PID control or is switched to PID control, the drive will monitor the PID feedback level for the time entered in P3-16. If the PID feedback level does not exceed the threshold entered in P3-17 before the time in P3-16 expires then the drive will trip with "Pr-Lo" (pressure low) trip.				
P3-17	<b>Burst Pipe Threshold</b>	<b>0.0</b>	<b>100.0</b>	<b>0.0</b>	%
	PID feedback threshold for the burst pipe detection. In direct PID mode, PID feedback should be equal to or greater than this threshold before the pump prime time (P3-16) expires. In inverse PID mode, PID feedback should be less than or equal to the threshold before the pump prime time (P3-16) expires.				
P3-18	<b>PID Reset Control</b>	<b>0</b>	<b>1</b>	<b>0</b>	-
	<b>0 : Continuous Run.</b> PID loop will continue running as long as P gain (P3-01) is not zero.				
	<b>1 : On drive Enable.</b> PID loop will only run when the drive is enabled. If the drive is not running, PID output will reset to 0 (Including integral result).				
P3-19	<b>Burst Pipe Detection Trip Delay</b>	<b>0</b>	<b>600</b>	<b>0</b>	<b>Seconds</b>
	When burst pipe detection is enabled by configuring parameters P3-16 & P3-17, this parameter adds a delay/filter to the "Pr-Lo" trip. This can be useful in situations where the system has been operating in steady state and sudden closing and then re-opening of valves can cause an overshoot of pressure followed by an undershoot which could trigger the "Pr-Lo" trip unnecessarily.				

## 9.3. Parameter Group 4 – High Performance Motor Control

### 9.3.1. Overview

Parameters relating to the motor control are located together in Group 4. These parameters allow the user to:

- Select the motor type to match the connected motor.
- Carry out an autotune.
- Define the torque limits and setpoint source for control methods that support this (vector control methods only).

Optidrive Eco can operate with both Asynchronous Induction Motors, the type most commonly seen today, and also some synchronous motors. The sections below provide basic guidance on how to adjust the parameters to operate with the required motor type.

### 9.3.2. Asynchronous IM Motors

#### IM Motor Control Methods

IM Motors may be operated in the following modes:

- Eco Vector Speed Control variable Torque (Default Mode)
  - This mode provides the simplest control, for use with regular centrifugal fans and pumps.
- Eco Vector Speed Control Constant Torque
  - This mode provides better control for constant torque loads like compressors, positive displacement pumps or centrifugal fans with high inertia.
- Induction Motor Vector Control
  - This mode is sometimes used for more challenging compressor applications. This mode does require more accurate setting of parameters and could require more detailed tuning of the gains for good operation.

#### Operating in Sensorless Vector Speed Control Mode

The Optidrive Eco is set to work in Eco Vector Speed Control (variable torque) by default, and should work in this setting for the majority of centrifugal fans or pumps. For optimum performance, an autotune can be carried out using the following procedure:

- Ensure advanced parameter access is enabled by setting P1-14 = 101.
- Enter the motor nameplate details into the relevant parameters as follows:
  - P1-07 Motor Rated Voltage
  - P1-08 Motor Rated Current
  - P1-09 Motor Rated Frequency
  - (Optional) P1-10 Motor Rated Speed (Rpm)
- Ensure that the motor is correctly connected to the drive.
- Carry out a motor data Autotune by setting P4-02 = 1.

The Autotune will begin immediately when P4-02 is set regardless of the status of the drive enable signal. Whilst the autotune procedure does not drive or spin the motor, the motor shaft may still turn slightly. It is not normally necessary to uncouple the load from the motor; however the user should ensure that no risk arises from the possible movement of the motor shaft.

It is essential that the correct motor data is entered into the relevant drive parameters. Incorrect parameter settings can result in poor or even dangerous performance.

### 9.3.3. Synchronous Motors

#### Overview

Optidrive Eco provides open loop vector control of the following synchronous motor types.

#### Permanent Magnet AC (PM AC) Motors and Brushless DC (BLDC) Motors

Optidrive Eco can be used to control Permanent Magnet AC or Brushless DC motors without a feedback encoder or resolver. These motors operate synchronously, and a vector control strategy is used to maintain correct operation. In general, the motor can be operated between 10% - 100% of rated speed with a correctly selected and configured drive. Optimum control is achieved when the motor back EMF / Rated speed ratio is  $\geq 1\text{V/Hz}$ . Motors with Back EMF / Rated frequency ratio below this level may not operate correctly, or may operate only with reduced speed range.

PM AC and BLDC motor control employs the same strategy, and the same commissioning method is applied.

Permanent Magnet motors (including BLDC) produce an output voltage known as the Back EMF when the shaft is rotated. The user must ensure that the motor shaft cannot rotate at a speed where this Back EMF exceeds the voltage limit for the drive, otherwise damage can occur.

The following parameter settings are necessary before attempting to operate the motor.

- Ensure advanced parameter access is enabled by setting P1-14 = 201 (default value for security access).
- Enter the motor nameplate details into the relevant parameters as follows:
  - P1-07 Back EMF at Rated Frequency / Speed (kE)  
This is the voltage imposed by the magnets at the drive output terminals when the motor operates at rated frequency or speed. Some motors may provide a value for volts per thousand RPM, and it may be necessary to calculate the correct value for P1-07.
  - P1-08 Motor Rated Current.
  - P1-09 Motor Rated Frequency.
  - (Optional) P1-10 Motor Rated Speed (Rpm).
- Select PM Motor Speed control mode by setting P4-01 = 3 or BLDC Motor Speed Control by setting P4-01 = 4.
- Ensure that the motor is correctly connected to the drive.
- Carry out a motor data Autotune by setting P4-02 = 1.
  - The autotune measures the electrical data required from the motor to ensure good control.
- To improve motor starting and low speed operation, the following parameters may require adjustment:
  - P7-14: Low Frequency Torque Boost Current: Injects additional current into the motor to help rotor alignment at low output frequency. Set as % of P1-08 (a setting of 10% is a good starting point).
  - P7-15: Low Frequency Torque Boost Frequency Limit: Defines the frequency range where the torque boost is applied. Set as % of P1-09 (a setting of 10% is a good starting point).

Following the steps above, it should be possible to operate the motor. Further parameter settings are possible to enhance the performance if required, please refer to your Invertek Drives Sales Partner for more information.

### 9.3.4. Synchronous Reluctance (Syn RM) Motors

When operating with Synchronous Reluctance motors, carry out the following steps:

- Ensure advanced parameter access is enabled by setting P1-14 = 201 (default value for security access).
- Enter the motor nameplate details into the relevant parameters as follows:
  - P1-07 Motor Rated Voltage.
  - P1-08 Motor Rated Current.
  - P1-09 Motor Rated Frequency.
  - (Optional) P1-10 Motor Rated Speed (Rpm).
  - P4-05 Motor Power Factor.
- Select Synchronous Reluctance Motor Control mode by setting P4-01 = 5.
- Ensure that the motor is correctly connected to the drive.
- Carry out a motor data Autotune by setting P4-02 = 1.

Incorrect adjustment of parameters in menu group 4 can cause unexpected behaviour of the motor and any connected machinery. It is recommended that these parameters are only adjusted by experienced users.

Par.	Parameter Name	Minimum	Maximum	Default	Units
P4-01	<b>Motor Control Mode</b>	0	6	0	-
	<b>0 : ECO Vector Speed Control - Variable Torque.</b> Suitable for control of variable torque (centrifugal) fans and pumps with standard (IM) motors.				
	<b>1 : ECO Vector Speed Control - Constant Torque.</b> Constant Torque, suitable for constant torque loads, such as displacement pumps with standard (IM) motors.				
	<b>2 : IM Motor, Vector Speed Control.</b> Control mode for IM Motors.				
	<b>3 : PM Motor, Vector Speed Control.</b> Control mode for AC Permanent Magnet Motors.				
	<b>4 : BLDC Motor, Vector Speed Control.</b> Control mode for Brushless DC Motors.				
	<b>5 : Sync RM Motor, Vector Speed Control.</b> Control mode for Synchronous Reluctance Motors.				
	<b>6 : LSPM Motor, Vector Speed Control.</b> Control mode for Line Start Permanent Magnet Motors.				
	<b>NOTE</b> Modes 0 and 1 do not require an autotune, although performance may be improved if one is carried out. Modes 2 and above require an autotune to be completed after the motor parameters are entered.				
P4-02	<b>Auto-tune Enable</b>	0	1	0	-
	When set to 1, the drive immediately carries out a non-rotating auto-tune to measure the motor parameters for optimum control and efficiency. Following completion of the auto-tune, the parameter automatically returns to 0.				
P4-03	<b>Vector Speed Controller Proportional Gain</b>	0.1	400.0	50.0	%
	Sets the proportional gain value for the speed controller. Higher values provide better output frequency regulation and response. Too high a value can cause instability or even over current trips. For applications requiring best possible performance, the value should be adjusted to suit the connected load by gradually increasing the value and monitoring the actual output speed of the load until the required dynamic behaviour is achieved with little or no overshoot where the output speed exceeds the setpoint.				
	In general, the factory set value will be suitable for most fan and pump applications, higher friction loads can tolerate higher values of proportional gain, and high inertia, low friction loads may require the gain to be reduced.				
P4-04	<b>Vector Speed Controller Integral Time Constant</b>	0.010	2.000	0.050	Seconds
	Sets the integral time for the speed controller. Smaller values provide a faster response in reaction to motor load changes, at the risk of introducing instability. For best dynamic performance, the value should be adjusted to suit the connected load.				
P4-05	<b>Motor Power Factor Cos Ø</b>	0.00	0.99	-	-
	When operating in Vector Speed motor control mode, this parameter must be set to the motor nameplate power factor.				
P4-07	<b>Maximum Torque / Current Limit</b>	20.0	200	110.0	%
	This parameter defines the maximum current or torque limit used by the drive.				
P4-12	<b>Thermal Overload Retention</b>	0	1	1	-
	<b>0 : Disabled.</b>				
	<b>1 : Enabled.</b> All Optidrives feature electronic thermal overload protection for the connected motor, designed to protect the motor against damage. An internal overload accumulator monitors the motor output current over time, and will trip the drive if the usage exceeds the thermal limit. When P4-12 is disabled, removing the power supply from the drive and re-applying will reset the value of the accumulator. When P4-12 is enabled, the value is retained during power off.				
P4-13	<b>Output Phase Sequence</b>	0	1	0	-
	<b>0 : U,V,W.</b>				
	<b>1 : U,W,V.</b> Direction of motor rotation when operating in a forward direction will be reversed.				
P4-14	<b>Thermal Overload Reaction</b>	0	2	1	-
	<b>0 : Trip.</b> When the overload accumulator reaches the limit, the drive will trip on Lt.trp to prevent damage to the motor.				
	<b>1 : Current Limit Reduction.</b> When the overload accumulator reaches 90%, the output current limit is internally reduced to 100% of P1-08 in order to avoid an Lt.trp. The current limit will return to the setting in P4-07 when the overload accumulator reaches 10%.				
	<b>2: Current Limit Reduction above minimum speed.</b> This mode is the same as mode 1 above, but is only activated once the motor has ramped up to the minimum speed set in P1-02.				

## 9.4. Parameter Group 5 – Communication Parameters

### 9.4.1. Overview

Optidrive Eco provides many methods to allow the user to connect to a variety of fieldbus networks. In addition, connection to options such as external keypads, PC and Optistick are possible. Parameter Group 5 provides the parameters required to configure the various fieldbus interfaces and connection points.

### 9.4.2. Connecting Invertek Drives Options

All Invertek Drives options which require communication with the drive, such as the Optiport and Optipad remote keypads and Optistick connect to the Optidrive Eco using the built in RJ45 connection point. The pin connections on these options are already matched, such that a simple pin to pin plug in cable can be used to connect these options without any special requirements.

For further information on connecting and using these optional items, refer to the specific option User guide.

### 9.4.3. Connecting to a PC

Optidrive Eco may be connected to a PC with Microsoft Windows operating system to allow use of the Optitools Studio PC software for commissioning and monitoring. There are two possible methods of connection as follows:

- Wired Connection. Requires the optional PC connection kit OPT-2-USB485-OBUS which provides a USB to RS485 serial port conversion and premanufactured RJ45 connection.
- Bluetooth Wireless Connection. Requires the optional Optistick OPT-3-STICK. The PC must have Bluetooth onboard or a suitable Bluetooth dongle which can support a Bluetooth serial connection.

With either communication method, the steps to establish a connection between the PC and drive are as follows:

- Download and install the Optitools Studio PC software to the PC.
- Start the software, and select the Parameter Editor function.
- If the drive address has been changed in parameter P5-01, ensure that in the Optitools Studio software the Network Scan Limit setting in the lower left corner of the screen is set to the same or higher value.
- In Optitools Studio select Tools > Communication Type.
  - If using the Optistick, Select BlueTooth.
  - If using the wired PC connection kit, select RS485.
- In Optitools Studio select Tools > Select COM Port > Select the COM port associated with the connection.
- Click the Scan Drive Network button in the lower left corner of the screen.

### 9.4.4. Modbus RTU Connection

Optidrive Eco supports Modbus RTU communication. Connection is made through the RJ45 connector. For further information refer to section 10.2. Modbus RTU Communications on page 70.

### 9.4.5. BACnet MSTP Connection

The Optidrive Eco supports BACnet MSTP communication. Connection is made through the RJ45 connector. For further information refer to section 10.3. BACnet MSTP on page 72.

### 9.4.6. Other Fieldbus Networks

Additional fieldbus network protocols are supported using optional interfaces. Refer to the Invertek Drives website for a list of supported protocols and the required interface option modules.

#### 9.4.7. Communication Parameters

Par.	Name	Minimum	Maximum	Default	Units
P5-01	<b>Drive Fieldbus Address</b>	1	63	1	-
	Sets the Fieldbus address for the Optidrive. When using Modbus RTU, this parameter sets the Node Address. Refer to section 10.2. Modbus RTU Communications for further information. Please note that if a higher Modbus address than 63 is required, P5-16 can be used – see P5-16 for further information. This parameter also determines the Optibus address of the drive for use with OptiTools Studio. When Using BACnet MS/TP, this parameter sets the MAC ID. Refer to section 10.3. BACnet MSTP for further information.				
P5-03	<b>Modbus RTU / BACnet MSTP Baud Rate</b>	9.6	115.2	115.2	kbps
	Sets the baud rate when Modbus/BACnet communications are used. 9.6kbps, 19.2kbps, 38.4kbps, 57.6kbps, 115 kbps, 76.8kbps.				
P5-04	<b>Modbus RTU / BACnet MSTP Data Format</b>	-	-	n-1	-
	Sets the expected Modbus telegram data format as follows: n-1 : No Parity, 1 stop bit. n-2 : No parity, 2 stop bits. D-1 : Odd parity, 1 stop bit. E-1 : Even parity, 1 stop bit.				
P5-05	<b>Communications Loss Timeout</b>	0.0	5.0	1.0	Seconds
	Sets the watchdog time period for the communications channel. If a valid telegram is not received by the Optidrive within this time period, the drive will assume a loss of communications has occurred and react as selected below (P5-07).				
P5-06	<b>Communications Loss Action</b>	0	3	0	-
	Controls the behaviour of the drive following a loss of communications as determined by the above parameter setting (P5-06). <b>0 : Trip &amp; Coast To Stop</b> <b>1 : Ramp to Stop Then Trip</b> <b>2 : Ramp to Stop Only (No Trip)</b> <b>3 : Run at Preset Speed 4</b>				
P5-07	<b>Fieldbus Ramp Control</b>	0	1	0	-
	Selects whether the acceleration and deceleration ramps are control directly via the Fieldbus, or by internal drive parameters P1-03 and P1-04. <b>0 : Disabled.</b> Ramps are control from internal drive parameters. <b>1 : Enabled.</b> Ramps are controlled directly by the Fieldbus.				
P5-08	<b>Fieldbus PDO4 Data Select</b>	0	7	1	-
	When using an optional Fieldbus interface, this parameter configures the parameter source for the 4th process data word transferred from the drive to the network master during cyclic communications: <b>0 : Motor torque.</b> Output torque in % to one decimal place, e.g. 500 = 50.0%. <b>1 : Motor power.</b> Output power in kW to two decimal places, e.g. 400 = 4.00kW. <b>2 : Digital input status.</b> Bit 0 indicates digital input 1 status, bit 1 indicates digital input 2 status etc. <b>3 : Analog input 2 signal level.</b> 0 to 1000 = 0 to 100.0%. <b>4 : Heatsink temperature.</b> 0 to 100 = 0 to 100°C. <b>5 : User register 1.</b> Can be accessed by PLC program or group 9 parameters. <b>6 : User register 2.</b> Can be accessed by PLC program or group 9 parameters. <b>7 : P0-80 value.</b> P0-80 value can be selected by P6-28.				
P5-09	<b>BACnet Device Instance Number (Low)</b>	0	65535	1	-
P5-10	<b>BACnet Device Instance Number (High)</b>	0	63	0	-
	When using BACNet MS/TP, these parameter together allow a unique Device Instance Number to be programmed into the drive. For further information on using BACnet MS/TP, refer to section 10.3. BACnet MSTP.				
P5-11	<b>BACnet Maximum Masters</b>	1	127	127	-
	Parameter defines the maximum address of any BACnet masters that can exist on the current local MSTP BACnet network. Refer to section 10.3. BACnet MSTP for further information. When the device is polling for the next master in the network it will not poll about the value set in P5-11. For example, if the value is set to 50 then when the drive finishes communicating and needs to pass control to the next master it will poll up to address 50 looking for a response before rolling back to address 0.				

Par.	Name	Minimum	Maximum	Default	Units
P5-12	<b>Fieldbus PDO-3 Data Select</b>	0	7	0	-
	When using an optional Fieldbus interface, this parameter configures the parameter source for the 3rd process data word transferred from the drive to the network master during cyclic communications:				
	<b>0 : Motor current.</b> With one decimal place, e.g. 100.				
	<b>1 : Motor power.</b> Output power in kW to two decimal places, e.g. 400 = 4.00kW.				
	<b>2 : Digital input status.</b> Bit 0 indicates digital input 1 status, bit 1 indicates digital input 2 status etc.				
	<b>3 : Analog input 2 signal level.</b> 0 to 1000 = 0 to 100.0%.				
	<b>4 : Heatsink temperature.</b> 0 to 100 = 0 to 100°C.				
	<b>5 : User register 1.</b> Can be accessed by PLC program or group 9 parameters.				
	<b>6 : User register 2.</b> Can be accessed by PLC program or group 9 parameters.				
	<b>7 : PO-80 value.</b> PO-80 value can be selected by P6-28.				
P5-13	<b>Fieldbus PDI-4 Function Select</b>	0	1	0	-
	When using an optional Fieldbus interface, this parameter configures the parameter source for the 4th process data word transferred from the network master to the drive during cyclic communications:				
	<b>0 : User ramp time.</b> In second with two decimal places.				
	<b>1 : User Register 4.</b> Can be accessed by PLC program or group 9 parameters.				
P5-14	<b>Fieldbus PDI-3 Function Select</b>	0	2	0	-
	When using an optional Fieldbus interface, this parameter configures the parameter source for the 3rd process data word transferred from the network master to the drive during cyclic communications:				
	<b>0 : Not used.</b> No function.				
	<b>1 : User Reference.</b> 0 to 1000 = 0% to 100.0%.				
	<b>2 : User Register 3.</b> Can be accessed by PLC program or group 9 parameters.				
P5-15	<b>Modbus Response Delay</b>	0	16	0	Chr
	Allows the user to configure an additional delay between the drive receiving a request via the Modbus RTU interface, and transmitting a reply. The value entered represents the delay in addition to the minimum delay permissible according to the Modbus RTU specification, and is expressed as the number of additional characters.				
P5-16	<b>Drive Modbus Address</b>	0	247	0	-
	The drive Modbus (and Optibus) address is set in P5-01 which has a maximum value of 63. If a higher Modbus address is required for a larger network, it can be set in this parameter.				
	If this parameter is set to a value greater than 0, this address will become the Drive Modbus address. If this value is set to 0, P5-01 determines the Drive Modbus address.				

## 9.5. Advanced Parameters

For Advanced Parameters, basic information only is provided in this guide. The parameter functions are described more fully in Optitools Studio PC software.

### 9.5.1. Parameter Group 6 – Advanced Configuration

Par.	Function	Setting Range		Default	Notes
<b>P6-01</b>	Firmware Upgrade Enable	0	Disabled	0	This parameter should not be adjusted by the user.
		1	Update I/O & P/S		
		2	Update I/O		
		3	Update P/S		
<b>P6-02</b>	Thermal Overload Management	4 – 32kHz (Model Dependent)		4 kHz	Minimum Effective Switching Frequency.
<b>P6-03</b>	Auto Reset Time Delay	1 – 60 Seconds		20s	
<b>P6-04</b>	Relay Output Hysteresis	0.0 – 25.0%		0.3%	
<b>P6-08</b>	Max Speed Reference Frequency	0 – 20kHz		0 kHz	
<b>P6-10</b>	Function Block Program Enable	0	Disabled	0	
		1	Enabled		
<b>P6-11</b>	Speed Hold Time on Enable	0 – 600s		0s	
<b>P6-12</b>	Speed Hold / DC Injection Time on Disable	0 – 250s		0s	
<b>P6-16</b>	STO Trip Enable	0	Disabled	0	When the drive is enabled, the drive will trip on 'Sto.Flt' in the event that the STO circuit is opened when the drive is running. If the drive is not running, the opening of the STO circuit results in the drive being INHIBITED.
		1	Enabled		
<b>P6-17</b>	CO2 2-stage Compressor Mode Enable	0	Disabled	0	This parameter adjusts the system gains for operating with highly unstable CO2 compressors. Enabling this parameter for other compressor types is likely to result in over current trips.
		1	Enabled		
<b>P6-18</b>	DC Injection Current	0.0 – 100.0%		0.0%	This function is active only for Induction Motors (IM) and Synchronous Reluctance Motor (SyncRM).
<b>P6-22</b>	Reset Fan Run Time	0	No Reset	0	
		1	Reset		
<b>P6-23</b>	Reset Energy Meters	0	No Reset	0	
		1	Reset		
<b>P6-24</b>	Maintenance Time Interval	0 – 60000 Hours		0 Hours	
<b>P6-25</b>	Reset Maintenance Indicator	0	No Reset	0	
		1	Reset		
<b>P6-26</b>	Analog Output 1 Scaling	0.0 – 500.0%		100.0%	
<b>P6-27</b>	Analog Output 1 Offset	-500.0 – 500.0%		0.0%	
<b>P6-28</b>	P0-80 Display Index	0 - 200		0	
<b>P6-29</b>	User Default Parameters	0	No Function	0	
		1	Save user parameters		
		2	Clear user parameters		
<b>P6-30</b>	Level 3 (Advanced) Access Code	0 – 9999		201	

## 9.5.2. Parameter Group 7 – Motor Control

Par.	Function	Setting Range	Default	Notes	
<b>P7-01</b>	Motor Stator Resistance	0.000 – 65.535	Drive Dependent	Motor data, measured or calculated during the autotune. P7-04 is not used for PM & BLDC Motors. P7-06 is used only for PM motors.	
<b>P7-03</b>	Motor Stator Inductance (d)	0.0000 – 1.0000			
<b>P7-04</b>	Magnetising Current (id)	Drive Dependent			
<b>P7-05</b>	Motor Leakage Coefficient (Sigma)	0.000 – 0.250			
<b>P7-06</b>	Motor Q Axis Inuctance (Lsq)	0.0000 – 1.0000			
<b>P7-09</b>	Over Voltage Current Limit	0.0 – 100.0%			
<b>P7-10</b>	Load Inertia Constant	0 - 600	10		
<b>P7-11</b>	Pulse Width Minimum Limit	0 - 500			
<b>P7-12</b>	V/F Mode Magnetising Delay Time	0 – 5000ms	Drive Dependent	Sets the motor magnetising period in V/F Mode. Sets the motor alignment time in PM modes.	
<b>P7-14</b>	Low Frequency Torque Boost	0.0 – 100.0%	0.0%	For PM Motors, applies a torque boost current at low frequency, % x P1-08.	
<b>P7-15</b>	Torque Boost Frequency Limit	0.0 – 50.0%	0.0%	For PM motors, determines the frequency, % x P1-09 when the boost current is removed.	
<b>P7-18</b>	Over Modulation	0 1 2	Disable Enable Auto	0	
<b>P7-19</b>	BLDC Light Load Optimization	0 1	Disable Enable		
<b>P7-20</b>	Modulation Mode	0 1	3-Phase Modulation 2-Phase Modulation	1	

## 9.6. Parameter Group 8 – Application Function Specific Parameters

Par.	Name	Minimum	Maximum	Default	Units
<b>P8-01</b>	<b>Pump Stir Interval Duration</b>	<b>0</b>	<b>60000</b>	<b>0</b>	<b>Minutes</b>
	This parameter can be used to set a pre-defined period of inactivity, whereby if the drive remains in standby mode for a period of time exceeding the limit, stir function is activated, and the drive will operate at preset speed 7 (P2-07) for the time set in P8-02. This allows the pump to stir, preventing sediment from settling and avoiding a blockage.				
<b>P8-02</b>	<b>Pump Stir Activation Time</b>	<b>1</b>	<b>6000</b>	<b>10</b>	<b>Seconds</b>
	Set the time period that the stir function will be active once triggered (excludes time for deceleration to stop).				
<b>P8-03</b>	<b>Pump Clean Function Select</b>	<b>0</b>	<b>3</b>	<b>-</b>	<b>-</b>
	This parameter configures the drive conditions that will cause activation of the automatic pump clean function. When activated, the pump clean will operate the pump at preset speed 5 (P2-05) for the time period set in P8-04, followed by Preset Speed 6 (P2-06) (Providing P2-06 > 0) for the time set in P8-04, before resuming normal operation. During the cleaning cycle, the ramp time set in P8-05 is used for both acceleration and deceleration, and overrides P1-03 and P1-04.  Where possible, P2-05 and P2-06 may be set to negative values, to allow the pump to be reversed. For best results, it is recommended to use as high a speed as possible, and to adjust P8-05 to allow a short acceleration time whilst avoiding over current trips.				
	<b>0 : Disabled.</b>				
	<b>1 : Active on start-up only.</b> The pump cleaning function operates every time the pump is started.				
	<b>2 : Active on start-up and high current detection.</b> The pump cleaning function operates every time the pump is started, and also in the event that the drive detects a possible pump blockage during normal operation. This requires the Motor Current Profile Monitoring function to be active and commissioned for correct operation, see parameter P8-06.				
	<b>3 : Active on high current detection only.</b> The pump cleaning function operates only when a possible pump blockage is detected during normal operation. This requires the Motor Current Profile Monitoring function to be active and commissioned for correct operation, see parameter P8-06.				
	<b>NOTE</b> The pump clean function can also be activated by digital input configured in group 9 parameters.				
<b>P8-04</b>	<b>Pump Clean Time</b>	<b>0</b>	<b>600</b>	<b>0</b>	<b>Seconds</b>
	Sets the time period for the operation of the pump cleaning cycle. When bi-directional pump cleaning is selected, the time interval is used twice, once in each direction.				

Par.	Name	Minimum	Maximum	Default	Units
P8-05	<b>Pump Clean Function Ramp Time</b>	0	6000	30	Seconds
	Independent ramp rate used only for the pump automatic cleaning function (see P8-03) when the motor is Accelerated as part of the cleaning cycle.				
P8-06	<b>Load Monitor Enable</b>	0	4	0	-
	This parameter enables the Total Motor Current Profile Monitoring Function, which can be used to detect belt failure in belt driven fan applications, or Dry Pump, Pump Blockage or broken impeller in Pump applications.				
	<b>0 : Disabled</b>				
	<b>1 : Low Current Detection Enabled (Belt Failure / Dry Pump / Broken Impeller)</b>				
	<b>2 : High Current Detection Enabled (Pump Blockage)</b>				
	<b>3 : Low and High Current Detection</b>				
	<b>4 : Low and High Current Detection, warning only.</b> Bit 7 of the status word goes high in the event of a high or low current being detected but the drive will not trip.				
	 Adjustment of parameter P8-06 (<>0) will cause the drive to automatically run the motor through its programmed frequency range upon the next drive enable (input enable). Ensure the application is in a suitable condition to allow the motor to run safely through its frequency range prior to enabling this feature.				
P8-07	<b>Load Profile Bandwidth</b>	0.1	50.0	1.0	Amps
	This parameter sets a bandwidth around the Motor Current profile generated by P8-06. If P8-06 has been set to an appropriate value to detect a high /low current condition and the drive operates outside of the bandwidth set in P8-07 for a period longer than that defined by P8-08 then the drive will trip. Value entered in P8-07 is the value between the normal current and the trip level, hence total bandwidth for the function is 2 x P8-07.				
P8-08	<b>Load Monitor Trip Delay</b>	0	60	0	Seconds
	This parameter sets a time limit for the Motor Current profile generated by P8-06. If P8-06 has been set to an appropriate value to detect a high /low current condition and the drive operates outside of the bandwidth set in P8-07 for a period longer than that defined by P8-08 and then the drive will trip.				
P8-09	<b>Fire Mode Logic</b>	0	1	0	-
	When Fire mode is assigned to a digital input on the drive then the logic configuration for the input is set by P8-09 to allow normally open or normally closed activation. Default behaviour is for Input logic off (0) to activate fire mode (Open activation).				
	Input configuration for Fire mode is set by parameter P1-13 or can be user defined by the setting of P9-32.				
	<b>0 : Open Activation</b>				
	<b>1 : Closed Activation</b>				
P8-10	<b>Fire Mode Speed</b>	-P1-01	P1-01	0	Hz / Rpm
	When set to a non-zero value, this parameter sets an operational fixed frequency / speed used when Fire Mode is selected. The drive will maintain operation at this frequency until the fire mode signal is removed or the drive is no longer able to sustain operation.				
	When P8-10 is zero, and fire mode is activated, the drive will continue to operate under the control of the selected speed reference, dependent on parameter settings and digital input selection.				
P8-11	<b>Bypass Mode on Fault</b>	0	1	0	-
	Parameter configures the drive to switch to bypass mode automatically should a trip occur on the drive. When enabled the drive standard relays 1 and 2 are dedicated to bypass control and cannot be assigned other functions.				
	<b>0 : Disabled</b>				
	<b>1 : Enabled</b>				
P8-12	<b>Bypass In Fire Mode</b>	0	1	0	-
	Parameter configures the drive to switch to bypass mode automatically should an input to the drive be configured for Fire Mode operation and that input becomes active. When enabled the drive standard relays 1 and 2 are dedicated to bypass control and cannot be assigned other functions.				
	<b>0 : Disabled</b>				
	<b>1 : Enabled</b>				
P8-13	<b>Bypass Contactor Change Over Time</b>	0	30	2	Seconds
	Parameter active when Bypass function is enabled. Parameter P8-05 sets a time delay or changeover time between the switching of the drive relays controlling the bypass circuitry.				
	 Care must be taken when setting P8-13 to ensure that drive and DOL contactors are not switched in circuit simultaneously. <b>Both Mechanical and Electrical interlocking of drive and DOL contactors to regional standards are recommended in configuring the Bypass function.</b>				

Par.	Name	Minimum	Maximum	Default	Units
P8-14	<b>Pump Staging Function Select</b>	0	5	0	-
	Parameter enables the pump staging (cascade) function on the drive. Contact your local sales partner for full detailed application notes concerning this parameter.				
	<b>0 : Disabled</b>				
	<b>1 : Single VFD with DOL Cascade (max 4 DOL pumps)</b>				
	<b>2 : Multiple Drive Cascade (Optiflow) Master Drive.</b> (Only valid when drive set to Optibus master address, P5-01 = 1).				
	<b>3 : Multiple Drive Cascade with Jockey Pump (Optiflow).</b> Master Drive (Only valid when drive set to Optibus master address, P5-01 = 1) In this instance, the Master drive (with address P5-01 =1) will remain active and will not be switched off to support the pump rotation ordinarily used for the purpose of sharing operating hours across all pumps.				
	<b>4 : Multiple Drive Cascade Mode 2 (Optiflow) Master Drive.</b> (Only valid when drive set to Optibus master address, P5-01 = 1) This mode is similar to mode 2 but the settling time is active on first start-up before introducing the first assist pump, which can prevent multiple pumps starting simultaneously when waking up from PID Standby mode.				
	<b>5 : Multiple Drive Cascade with Jockey Pump Mode 2 (Optiflow) Master Drive.</b> (Only valid when drive set to Optibus master address, P5-01 = 1) This mode is the same as mode 3 except that when an assist pump starts, the lead pump (jockey pump) will stop. When the assist pump goes into standby mode, the lead pump (jockey pump) will start again.				
P8-15	<b>Number of Assist Pumps</b>	1	4	1	-
	Parameter valid when P8-14 is set greater than 0 to enable Pump Staging Function. P8-15 set the number of assist pumps (P8-14 = 1) or network slave drives (P8-14>= 2) that are available in the Pump Staging application.				
P8-16	<b>Pump Duty Changeover Time</b>	0	1000	0	Hours
	In order to balance run time (duty) on each pump in the Pump staging application and to ensure periodic operation of each pump P8-16 can be set with a time limit for pump switch over. When set to a value other than 0 (disabled) the operation of each staging pump will be cycled to ensure the difference in duty between each pump does not exceed the time set in P8-16.				
P8-17	<b>Assist Pump Start Speed</b>	P8-18	P1-01	49.0	Hz / Rpm
	This parameter defines the speed at which an "Assist" Pump is started when using the Pump Cascade or Optiflow feature. When the drive output increases beyond this threshold the next Staging pump is switch on. The Pump staging settle time must then expire before additional staging pumps can be brought on or off line. Priority for Staging pump switch on is always given to the pump with lowest run time accumulated.				
P8-18	<b>Assist Pump Stop Speed</b>	0	P8-17	30.0	Hz / Rpm
	This parameter defines the speed at which an "Assist" Pump is stopped when using the Pump Cascade or Optiflow feature. When the drive output decreases below this threshold one of the Staging pumps currently operating is switch off. The Pump staging settle time must then expire before additional staging pumps can be brought on or off line. Priority for Staging pump switch off is always given to the pump with highest run time accumulated.				
P8-19	<b>Pump Settling Time</b>	2	600	60	Seconds
	Parameter sets a time delay for pump staging whereby, following switch in or switch out of a staging pump, further pumps are not permitted to be switched in or out until this time period has elapsed. This parameter should be set to allow adequate settle time between staging pump transitions.				
P8-20	<b>Pump Master Clock Reset</b>	0	1	0	-
	Master drive in pump staging monitors and maintains duty run times for all available staging pumps. All clocks are available to view in P0-20. P8-20 provides the master reset to all run time clocks used for Pump Staging Function (all clocks set to 0).				

## 9.7. Fire Mode

The Fire Mode function is designed to ensure continuous operation of the drive in emergency conditions until the drive is no longer capable of sustaining operation.

The Fire Mode input may be Normally Open (Close to Activate Fire Mode) or Normally Closed (Open to Activate Fire Mode) according to the setting of P8-09. This input may be linked to a fire control system to allow maintained operation in emergency conditions, e.g. to clear smoke or maintain air quality within the building. The fire mode function is enabled when P1-13 = 4, 8 or 13 with Digital Input 2 assigned to activate fire mode or can be user defined by the setting of P9-32 when P1-13 = 0.

Fire Mode disables the following protection features in the drive: O-t (Heat-sink Over-Temperature), U-t (Drive Under Temperature), Th-Flt (Faulty Thermistor on Heat-sink), E-trip (External Trip), 4-20 F (4-20mA fault), Ph-lb (Phase Imbalance), P-Loss (Input Phase Loss Trip), SC-trp (Communications Loss Trip), I.t-trp (Accumulated overload Trip). The following faults will result in a drive trip, auto reset and restart: O-Volt (Over Voltage on DC Bus), U-Volt (Under Voltage on DC Bus), h O-I (Fast Over-current Trip), O-I (Instantaneous over current on drive output), Out-F (Drive output fault, Output stage trip).

When Fire Mode is activated, the drive will enter Fire Mode but will run from the existing control source selected – it will require the run signal and relevant speed reference.

If Fire Mode speed is set (<>0) in P8-10, when fire mode is activated, the drive will enter Fire Mode and run at the speed set in P8-10 and will ignore all other terminals with the exception of the STO.

## 9.8. Parameter Group 9 – User Inputs and Output Programming

Par.	Function	Setting Range		Default	Notes		
<b>P9-01</b>	Enable Input Source	These parameters allow the user to directly select the source of the various command points. Parameters are only adjustable if P1-13 = 0. This allows complete flexibility over the drive control functions, and interaction with the internal Function Block programming environment.		0			
<b>P9-02</b>	Fast Stop Input Source						
<b>P9-03</b>	Run Forward Input Source						
<b>P9-04</b>	Run Reverse Input Source						
<b>P9-05</b>	Latch Function Enable	0	OFF	0			
		1	ON				
<b>P9-06</b>	Reverse Input Source	See above					
<b>P9-07</b>	Reset Input Source						
<b>P9-08</b>	External Trip Input Source						
<b>P9-09</b>	Terminal Control Select Source						
<b>P9-10</b>	Speed Reference Source 1	In combination with P9-18 – P9-20, allow selection of several speed reference sources for common applications.					
<b>P9-11</b>	Speed Reference Source 2						
<b>P9-12</b>	Speed Reference Source 3						
<b>P9-13</b>	Speed Reference Source 4						
<b>P9-14</b>	Speed Reference Source 5						
<b>P9-15</b>	Speed Reference Source 6						
<b>P9-16</b>	Speed Reference Source 7						
<b>P9-17</b>	Speed Reference Source 8						
<b>P9-18</b>	Speed Reference Select Input 0	See above					
<b>P9-19</b>	Speed Reference Select Input 1						
<b>P9-20</b>	Speed Reference Select Input 2						
<b>P9-21</b>	Preset Speed Select Input 0						
<b>P9-22</b>	Preset Speed Select Input 1						
<b>P9-23</b>	Preset Speed Select Input 2						
<b>P9-28</b>	Motorised Pot Up Input Source						
<b>P9-29</b>	Motorised Pot Down Input Source						
<b>P9-32</b>	Fire Mode Input Select	These parameters allow the user to override the normal parameter control source for the associated function, allowing interaction with the internal Function Block programming environment.					
<b>P9-33</b>	Analog Output 1 Source	0	Defined by P2-11				
		1	Function block program - digital				
		2	Function block program - analog				
<b>P9-34</b>	Analog Output 2 Source	0	Defined by P2-13	0			
		1	Function block program - digital				
		2	Function block program - analog				
<b>P9-35</b>	Relay 1 Control Source	0	Defined by P2-15	0			
		1	Function block program - digital				
<b>P9-36</b>	Relay 2 Control Source	0	Defined by P2-18	0			
		1	Function block program - digital				
<b>P9-37</b>	Display Scaling Source Control	0	Defined by P2-21	0			
		1	Function block program - digital				
<b>P9-38</b>	PID Reference Source	0	Defined by P3-05	0			
		1	Function block program - digital				
<b>P9-39</b>	PID Feedback Source	0	Defined by P3-10	0			
		1	Function block program - digital				
<b>P9-41</b>	Relay 3,4,5 Function	0	Healthy : Tripped : Running	0			
		1	Function block program - digital				
<b>P9-42</b>	Clean Trigger Source (edge)						
<b>P9-43</b>	Bypass Mode Trigger Source						
<b>P9-44</b>	PID Second Digital Ref Select						

## 9.9. Parameter Group 0 – Monitoring Parameters (Read Only)

Par.	Parameter Name	Units
<b>P0-01</b>	<b>Analog Input 1 Value</b>	%
	Displays the signal level applied to analog input 1 (Terminal 6) after scaling and offsets have been applied.	
<b>P0-02</b>	<b>Analog Input 2 Value</b>	%
	Displays the signal level applied to analog input 2 (Terminal 10) after scaling and offsets have been applied.	
<b>P0-03</b>	<b>Digital Input Status</b>	<b>Binary</b>
	Displays the status of the drive inputs, including the extended I/O module (if fitted). 1st Entry: 00000 ... 11111. Drive digital Input status. MSB represents digital input 1 / LSB representing digital input 5. 2nd Entry: E 000 ... E 111. Drive Extended (option) Input status. MSB represents digital input 6 / LSB representing digital input 8.	
<b>P0-04</b>	<b>Speed Controller Reference</b>	<b>Hz / Rpm</b>
	Displays the set point reference input applied to the drive internal speed controller.	
<b>P0-06</b>	<b>Digital Speed Reference</b>	<b>Hz / Rpm</b>
	Displays the value of the drive internal Motorised Pot (used for keypad) speed reference.	
<b>P0-07</b>	<b>Fieldbus Speed Reference</b>	<b>Hz / Rpm</b>
	Displays the set-point being received by the drive from the currently active Fieldbus interface.	
<b>P0-08</b>	<b>PID Reference</b>	%
	Displays the set-point input to the PID controller.	
<b>P0-09</b>	<b>PID Feedback</b>	%
	Displays the Feedback input signal to the PID controller.	
<b>P0-10</b>	<b>PID Output</b>	%
	Displays the output level of the PID controller.	
<b>P0-11</b>	<b>Motor Voltage</b>	<b>Volts</b>
	Displays the instantaneous output voltage from the drive to the motor.	
<b>P0-12</b>	<b>Output Torque</b>	<b>Nm</b>
	Displays the instantaneous output torque level produced by the motor.	
<b>P0-13</b>	<b>Trip Log</b>	-
	Displays the last four fault codes for the drive. Refer to section 12.1. Fault Messages for further information.	
<b>P0-14</b>	<b>Magnetising Current (Id)</b>	<b>Amps</b>
	Displays the motor magnetising Current, providing an auto tune has been successfully completed.	
<b>P0-16</b>	<b>DC Bus Voltage Ripple</b>	<b>Volts</b>
	Displays the level of ripple present on the DC Bus Voltage. This parameter is used by the Optidrive for various internal protection and monitoring functions.	
<b>P0-17</b>	<b>Motor Stator Resistance (Rs)</b>	<b>Ohms</b>
	Displays the measured motor stator resistance, providing an auto tune has been successfully completed.	
<b>P0-19</b>	<b>Cascade Run Time Log</b>	<b>Hours</b>
	Run Time values for variable speed and DOL pumps used in cascade function. 5 entry log. 0 = Master, 1 = DOL1, 2 = DOL2, 3 = DOL3, 4 = DOL4. Clocks can be reset through P8-20, Master Clock Reset.	
<b>P0-20</b>	<b>DC Bus Voltage</b>	<b>Volts</b>
	Displays the instantaneous DC Bus Voltage internally within the drive.	
<b>P0-21</b>	<b>Heatsink Temperature</b>	<b>°C</b>
	Displays the Instantaneous Heatsink Temperature measured by the drive.	
<b>P0-22</b>	<b>Time Left to Next Service</b>	<b>Hours</b>
	Displays the current time period remaining before the next maintenance becomes due. Maintenance interval is based on the value entered in P6-24 (Maintenance Time Interval) and the elapsed time since the maintenance interval was enabled or reset.	

Par.	Parameter Name	Units
P0-23	<b>Time Heatsink &gt;85°C</b>	HH:MM:SS
	Two entry display: First display shows hours. Second display shows minutes and seconds. Displays the amount of time in hours and minutes that the Optidrive has operated for during its lifetime with a heatsink temperature in excess of 85°C. This parameter is used by the Optidrive for various internal protection and monitoring functions.	
P0-24	<b>Time Internal &gt;80°C</b>	HH:MM:SS
	Two entry display: First display shows hours. Second display shows minutes and seconds. Displays the amount of time in hours and minutes that the Optidrive has operated for during its lifetime with an ambient temperature in excess of 80°C. This parameter is used by the Optidrive for various internal protection and monitoring functions.	
P0-25	<b>Estimated Rotor Speed</b>	Hz
	Displays the estimated rotor speed of the motor.	
P0-26	<b>kWh Meter</b>	kWh
	Two entry display: First display shows user resettable meter (reset with P6-23). Second display shows none resettable value. Displays the amount of energy consumed by the drive in kWh. When the value reaches 1000, it is reset back to 0.0, and the value of P0-27 (MWh meter) is increased.	
P0-27	<b>MWh Meter</b>	MWh
	Two entry display: First display shows user resettable meter (reset with P6-23). Second display shows none resettable value. Displays the amount of energy consumed by the drive in MWh.	
P0-28	<b>Software Version</b>	-
	Displays the software version of the drive: Four entry display: First display = IO Version, Second display = IO Checksum, Third display = DSP Version, Fourth display = DSP Checksum	
P0-29	<b>Drive Type</b>	-
	Displays the type details of the drive: Three entry display: First display = Frame size and input voltage level. Second display = Power rating. Third display = Output phase count.	
P0-30	<b>Drive Serial Number</b>	-
	Displays the unique serial number of the drive. Dual entry display: First display = Serial number (MSB), Second display = Serial number (LSB).	
P0-31	<b>Total Run Time</b>	HH:MM:SS
	Two entry display: First display shows hours. Second display shows minutes and seconds. Displays the total operating time of the drive.	
P0-32	<b>Run Time Since Last Trip 1</b>	HH:MM:SS
	Two entry display: First display shows hours. Second display shows minutes and seconds. Displays the total operating time of the drive since the last fault occurred. Run-time clock stopped by drive disable (or trip), reset on next enable only if a trip occurred. Reset also on next enable after a drive power down.	
P0-33	<b>Run Time Since Last Trip 2</b>	HH:MM:SS
	Two entry display: First display shows hours. Second display shows minutes and seconds. Displays the total operating time of the drive since the last fault occurred. Run-time clock stopped by drive disable (or trip), reset on next enable only if a trip occurred (under-volts not considered a trip) – not reset by power down / power up cycling unless a trip occurred prior to power down.	
P0-34	<b>Run Time Since Last Enable</b>	HH:MM:SS
	Two entry display: First display shows hours. Second display shows minutes and seconds. Displays the total operating time of the drive since the last Run command was received.	
P0-35	<b>Cooling Fan Operating Lifetime</b>	HH:MM:SS
	Displays the total operating time of the Optidrive internal cooling fans. Two entry display: First display shows user resettable time (reset with P6-22). Second display shows none resettable time. This is used for scheduled maintenance information.	
P0-36	<b>DC Bus Voltage Log (256ms)</b>	Volts
	Diagnostic log for DC bus voltage. Values logged every 256ms with 8 samples total. Logging suspended on drive trip.	

Par.	Parameter Name	Units
<b>P0-37</b>	<b>DC Bus Voltage Ripple Log (20ms)</b>	<b>Volts</b>
	Diagnostic log for DC bus voltage ripple. Values logged every 20ms with 8 samples total. Logging suspended on drive trip.	
<b>P0-38</b>	<b>Heatsink Temperature Log (30s)</b>	<b>°C</b>
	Diagnostic log for heatsink temperature. Values logged every 30s with 8 samples total. Logging suspended on drive trip.	
<b>P0-39</b>	<b>Internal Temperature Log (30s)</b>	<b>°C</b>
	Diagnostic log for drive ambient temperature. Values logged every 30s with 8 samples total. Logging suspended on drive trip.	
<b>P0-40</b>	<b>Motor Current Log (256ms)</b>	<b>Amps</b>
	Diagnostic log for Motor Current. Values logged every 256ms with 8 samples total. Logging suspended on drive trip.	
<b>NOTE</b> The above parameters (P0-36 to P0-40) are used to store the history of various measured levels within the drive at various regular time intervals prior to a trip. The values are frozen when a fault occurs and can be used for diagnostic purposes.		
<b>P0-41</b>	<b>Over Current Fault Counter</b>	-
<b>P0-42</b>	<b>Over Voltage Fault Counter</b>	-
<b>P0-43</b>	<b>Under Voltage Fault Counter</b>	-
<b>P0-44</b>	<b>Heatsink Over Temperature Fault Counter</b>	-
<b>P0-45</b>	<b>Reserved</b>	-
<b>P0-46</b>	<b>Ambient Over Temperature Fault Counter</b>	-
<b>NOTE</b> These parameters (P0-41 to P0-46) contain a record of how many times certain critical faults have occurred during a drives operating lifetime. This provides useful diagnostic data.		
<b>P0-47</b>	<b>I/O Comms Fault Counter</b>	-
	Displays the number of communication errors detected by the I/O processor in messages received from the power stage processor since the last power up.	
<b>P0-48</b>	<b>DSP Comms Fault Counter</b>	-
	Displays the number of communication errors detected by the Power Stage processor in messages received from the I/O processor since the last power up.	
<b>P0-49</b>	<b>Modbus RTU / BACnet MSTP Fault Counter</b>	-
	This parameter is incremented every time an error occurs on the Modbus RTU communication link. This information can be used for diagnostic purposes.	

# 10. Serial Communications

## 10.1. RS-485 Communications

Optidrive Eco has an RJ45 connector located within the wiring enclosure of the drive. This connector allows the user to set up a drive network via a wired connection. The connector contains two independent RS485 connections, one for Invertek's Optibus Protocol and one for Modbus RTU / BACnet MSTP. Both connections can be used simultaneously.

The electrical signal arrangement of the RJ45 connector is shown as follows:

- There are two RJ45 ports present in the IP66 outdoor rated drive. The two RJ45 ports are connected in parallel internally to help support a network connection without the need for a splitter. Either port can be used.
- The Optibus data link is only used for connection of Invertek peripherals and inter-drive communication.
- The Modbus interface allows connection to a Modbus RTU network as described in section 10.2. Modbus RTU Communications.

### 10.1.1. RS-485 Communications Electrical Connections

Modbus RTU and BACnet MSTP connection should be made via the RJ45 connector. The pin assignments are as shown in section 10.1. RS-485 Communications on page 69.

- Modbus RTU and BACnet MSTP networks require three conductors for best operation and to eliminate common mode voltages on the drive terminals:
  - RSR85+
  - RS485-
  - 0 Volt Common
- Connection should be made using a suitable dual twisted pair, shielded cable, with a wave impedance of 120R.
- Use one of the twisted pairs to connect to the RS485+ and RS485- of each drive.
- Use one conductor of the remaining pair to connect together all the 0 volt common connection terminals.
- The cable shield should be connected to a suitable clean ground point to prevent interference with the screen maintained as close as possible to the cable terminations.
- Do not connect the 0 Volt Common, RS485- or RS485+ to ground at any point.
- Network terminating resistor (120R) should be used at the end of the network to reduce noise.

## 10.2. Modbus RTU Communications

### 10.2.1. Modbus Telegram Structure

The Optidrive Eco supports Master / Slave Modbus RTU communications, using the O3 Read Multiple Holding Registers and O6 Write Single Holding Register commands and 16 Write Multiple Holding Registers (Supported for registers 1 – 4 only). Many Master devices treat the first Register address as Register 0; therefore it may be necessary to convert the Register Numbers detail in section 10.2.2. Modbus Control & Monitoring Registers by subtracting 1 to obtain the correct Register address.

### 10.2.2. Modbus Control & Monitoring Registers

The following is a list of accessible Modbus Registers available in the Optidrive Eco.

- When Modbus RTU is configured as the Fieldbus option, all of the listed registers can be accessed.
- Registers 1 and 2 can be used to control the drive provided that Modbus RTU is selected as the primary command source (P1-12 = 4) and no Fieldbus Option Module is installed in the drive Option Slot.
- Register 4 can be used to control the acceleration and deceleration rate of the drive providing that Fieldbus Ramp Control is enabled (P5-07 = 1).
- Registers 6 to 24 can be read regardless of the setting of P1-12.

Register Number	Upper Byte	Lower Byte	Read Write	Notes
1	Command Control Word		R/W	Command control word used to control the Optidrive when operating with Modbus RTU. The Control Word bit functions are as follows: Bit 0 : Run/Stop command. Set to 1 to enable the drive. Set to 0 to stop the drive. Bit 1 : Fast stop request. Set to 1 to enable drive to stop with 2nd deceleration ramp. Bit 2 : Reset request. Set to 1 in order to reset any active faults or trips on the drive. This bit must be reset to zero once the fault has been cleared. Bit 3 : Coast stop request. Set to 1 to issue a coast stop command.
2	Command Speed Reference		R/W	Setpoint must be sent to the drive in Hz to one decimal place, e.g. 500 = 50.0Hz.
3	Reserved		R/W	No Function.
4	Command Ramp times		R/W	This register specifies the drive acceleration and deceleration ramp times used when Fieldbus Ramp Control is selected (P5-08 = 1) irrespective of the setting of P1-12. The input data range is from 0 to 60000 (0.00s to 600.00s).

Register Number	Upper Byte	Lower Byte	Read Write	Notes
6	Error code	Drive status	R	<p>This register contains 2 bytes.</p> <p>The Lower Byte contains an 8 bit drive status word as follows:</p> <ul style="list-style-type: none"> <li>Bit 0 : 0 = Drive Disabled (Stopped), 1 = Drive Enabled (Running).</li> <li>Bit 1 : 0 = Drive Healthy, 1 = Drive Tripped.</li> <li>Bit 2: 0 = Auto, 1 = Hand.</li> <li>Bit 3 : Inhibit.</li> <li>Bit 4 : Service due.</li> <li>Bit 5 : Standby.</li> <li>Bit 6 : Drive Ready.</li> <li>Bit 7 : 0 = Normal condition, 1 = Low or High Load condition detected.</li> </ul> <p>The Upper Byte will contain the relevant fault number in the event of a drive trip. Refer to section 12.1. Fault Messages for a list of fault codes and diagnostic information.</p>
7	Output Frequency		R	Output frequency of the drive to one decimal place, e.g.123 = 12.3 Hz.
8	Output Current		R	Output current of the drive to one decimal place, e.g.105 = 10.5 Amps.
9	Output Torque		R	Motor output torque level to one decimal place, e.g. 474 = 47.4 %.
10	Output Power		R	Output power of the drive to two decimal places, e.g.1100 = 11.00 kW.
11	Digital Input Status		R	Represents the status of the drive inputs where Bit 0 = Digital Input 1 etc.
20	Analog 1 Level		R	Analog Input 1 Applied Signal level in % to one decimal place, e.g. 1000 = 100.0%.
21	Analog 2 Level		R	Analog Input 2 Applied Signal level in % to one decimal place, e.g. 1000 = 100.0%.
22	Pre Ramp Speed Reference		R	Internal drive frequency set-point.
23	DC Link Voltage		R	Measured DC Link Voltage VDC (P0-20).
24	Drive Temperature		R	Measured Heatsink Temperature in °C (P0-21).
30	kWh Meter (User Resettable)		R	User resettable energy meter kWh (P0-26).
31	MWh Meter (User Resettable)		R	User resettable energy meter MWh (P0-27).
32	kWh Meter (Non Resettable)		R	Non resettable energy meter kWh (P0-26).
33	MWh Meter (Non Resettable)		R	Non resettable energy meter MWh (P0-27).
34	Running Time – Hours		R	Total running time (Hours) (P0-31).
35	Running Time – Min & Sec		R	Total Running Time (Minutes & Seconds) (P0-31).

### 10.2.3. Modbus Parameter Access

All User Adjustable parameters (Groups 1 to 5) are accessible by Modbus, except those that would directly affect the Modbus communications, e.g.

- P5-01 Drive Fieldbus Address – see also P5-16 Drive Modbus Address.
- P5-03 Modbus RTU Baud Rate.
- P5-04 Modbus RTU Data Format.

All parameter values can be read from the drive and written to, depending on the operating mode of the drive – some parameters cannot be changed whilst the drive is enabled for example.

When accessing a drive parameter via Modbus, the Register number for the parameter is the same as the parameter number, e.g. Parameter P1-01 = Modbus Register 101.

Modbus RTU supports sixteen bit integer values, hence where a decimal point is used in the drive parameter, the register value will be multiplied by a factor of ten,

e.g. Read Value of P1-01 = 500, therefore this is 50.0Hz.

For further details on communicating with the Optidrive using Modbus RTU, please refer to your local Invertek Sales Partner.

## 10.3. BACnet MSTP

### 10.3.1. Overview

Optidrive Eco provides an interface for direct connection to a BACnet MSTP network. Connection is made via the RJ45 connection port, see section 10.1. RS-485 Communications for terminal assignment and section 10.1.1. RS-485 Communications Electrical Connections for wiring requirements.

### 10.3.2. Interface Format

Protocol	:	BACnet MSTP
Physical signal	:	RS485, half duplex
Interface	:	RJ45
Baudrate	:	9600bps, 19200bps, 38400bps, 76800bps
Data format	:	8N1, 8N2, 8E1, 8O1

### 10.3.3. BACnet MSTP Parameters

The following parameters are used to configure the drive when connecting to a BACnet MSTP network.

Par.	Parameter Name	Description
P1-12	Control Source	Set this parameter to 6 to activate BACnet MSTP operation.
P5-01	Drive Address	This parameter is used to set the drive address on the BACnet network. Each drive on a given network should have a unique value. By default, all drives are set to MAC ID 1.
P5-03	Baudrate	This parameter is used to set up communication baudrate. It should be set to match the chosen baudrate of the BACnet system. Auto baudrate is not supported.
P5-04	Data Format	Use this parameter to set RS485 communication data format. Possible settings are as follows: n-1 : No parity, one stop bit (default setting) n-2 : No parity, two stop bits O-1 : Odd parity, one stop bit E-1 : Even parity, one stop bit The setting must match the requirement of the BACnet network.
P5-07	Fieldbus Ramp Control	This parameter determines whether the acceleration and deceleration time of the drive is controlled by the drive internal parameters (P1-03 : Acceleration Time, P1-04 : Deceleration Time), or controlled directly from the BACnet MSTP network. In most cases, using the drive internal parameters is the best solution.
P5-09	BACnet Device Instance ID Low	P5-09 and P5-10 are used to setup drive device instance ID value. Instance ID = (P5-10 * 65536) + P5-09. The allowed setting range is Range from 0 ~ 4194304. Default value is set to 1.
P5-10	BACnet Device Instance ID High	
P5-11	Max Master	Set BACnet MS/TP max master property, range from 1 ~ 127. Default set to 127.

### 10.3.4. BACNet MSTP Commissioning

In order to connect the drive and operate on a BACnet MSTP network, the following procedure should be used.

1. Set P1-14 = 101 to allow access to the extended parameters.
2. On each drive, set an unique Drive Address in parameter P5-01.
3. Set the required baudrate in P5-03.
4. Select the required data format in P5-04.
5. Define a unique BACnet Device Instance ID for each drive using parameters P5-09 and P5-10.
6. Select control from BACnet connection by setting P1-12 = 6.

### 10.3.5. Object Dictionary

#### Binary Value Object:

Binary Value Objects Table				
Instance ID	Object Name	Access	Description	Active/Inactive Text
BVO	Run/Stop State	R	This object indicates drive run status	RUN/STOP
BV1	Trip State	R	This object indicates if drive is tripped	TRIP/OK
BV2	Hand Mode	R	This object indicates if drive is in hand or auto mode	HAND/AUTO
BV3	Inhibit Mode	R	This object indicates drive is hardware inhibit	INHIBIT/OK
BV4	Mains Loss	R	This object indicates if mains loss happened	YES/NO
BV5	Fire Mode	R	This object indicates drive is in fire mode	ON/OFF
BV6	Enable State	R	This object indicates if drive has enable signal	YES/NO
BV7	External 24V Mode	R	This object indicates drive is in external 24V mode	YES/NO
BV8	Maintenance Due	R	This object indicates if maintenance service is due	YES/NO
BV9	Clean Mode	R	This object indicates if pump clean function is on	ON/OFF
BV10	Terminal Mode	R	This object indicates if drive is in terminal control mode	ON/OFF
BV11	Bypass Mode	R	This object indicate if drive is in bypass mode	ON/OFF
BV12	Digital Input 1	R	Status of digital input 1	ON/OFF
BV13	Digital Input 2	R	Status of digital input 2	ON/OFF
BV14	Digital Input 3	R	Status of digital input 3	ON/OFF
BV15	Digital Input 4	R	Status of digital input 4	ON/OFF
BV16	Digital Input 5	R	Status of digital input 5	ON/OFF
BV17	Digital Input 6	R	Status of digital input 6	ON/OFF
BV18	Digital Input 7	R	Status of digital input 7	ON/OFF
BV19	Digital Input 8	R	Status of digital input 8	ON/OFF
BV20	Relay Output 1	R	Status of relay output 1	CLOSED/OPEN
BV21	Relay Output 2	R	Status of relay output 2	CLOSED/OPEN
BV22	Relay Output 3	R	Status of relay output 3	CLOSED/OPEN
BV23	Relay Output 4	R	Status of relay output 4	CLOSED/OPEN
BV24	Relay Output 5	R	Status of relay output 5	CLOSED/OPEN
BV25	Run/Stop CMD	C	Drive run command object	RUN/STOP
BV26	Fast Stop	C	Fast stop enable object	ON/OFF
BV27	Trip Reset	C	Trip reset object (rising edge active)	ON/OFF
BV28	Coast Stop	C	Cost stop enable object (overrides fast stop)	ON/OFF
BV29*	Relay 1 CMD	C	User specified relay output 1 status	CLOSED/OPEN
BV30*	Relay 2 CMD	C	User specified relay output 2 status	CLOSED/OPEN
BV31*	Relay 3 CMD	C	User specified relay output 3 status	CLOSED/OPEN
BV32*	Relay 4 CMD	C	User specified relay output 4 status	CLOSED/OPEN
BV33*	Relay 5 CMD	C	User specified relay output 5 status	CLOSED/OPEN

\* This function only works if the relay output can be controlled by user value (Refer to the Optidrive Eco Parameter List for further details)

## Analog Value Object

Analog Value Objects Table					
Instance ID	Object Name	Access	Description	Units	
AV0	Motor Frequency	R	Motor output frequency		Hertz
AV1	Motor Speed	R	Motor output speed (0 if P1-10=0)		Rpm
AV2	Motor Current	R	Motor output current		Amps
AV3	Motor Power	R	Motor output power		Kilowatts
AV4	Motor torque	R	Reserved		%
AV5	DC Bus Voltage	R	DC bus voltage		Volts
AV6	Drive temperature	R	Drive temperature value		°C
AV7	Drive Status	R	Drive status word		NONE
AV8	Trip Code	R	Drive trip code		NONE
AV9	Analog input 1	R	Value of analog input 1		Percent
AV10	Analog input 2	R	Value of analog input 2		Percent
AV11	Analog output 1	R	Value of analog output 1		Percent
AV12	Analog output 2	R	Value of analog output 2		Percent
AV13	PID Reference	R	PID controller reference value		Percent
AV14	PID feedback	R	PID controller feedback value		Percent
AV15	Speed Reference	C	Speed reference value object		Hertz
AV16	User Ramp Time	W	User ramp value		Seconds
AV17	User PID Reference	W	PID controller user reference		Percent
AV18	User PID Feedback	W	PID controller user feedback		Percent
AV19	Kilowatt Hours	R	Kilowatt hours (can be reset by user)		Kilowatt-hours
AV20	Megawatt Hours	R	Megawatt hours (can be reset by user)		Megawatt-hours
AV21	KWh meter	R	Kilowatt hours meter (cannot be reset)		Kilowatt-hours
AV22	MWWh meter	R	Megawatt hours meter (cannot be reset)		Megawatt-hours
AV23	Total Run Hours	R	Total run hours since date of manufacture		Hours
AV24	Current Run Hours	R	Run hours since last time enable		Hours

### 10.3.6. Access type

R - Read only

W - Read or Write

C - Commandable

### 10.3.7. Supported Service

- WHO-IS (Reply with I-AM, and I-AM will also be broadcasted on power up and reset)
- WHO-HAS (Reply with I-HAVE)
- Read Property
- Write Property
- Device Communication Control
- Reinitialize Device

### 10.3.8. Object/Property Support Matrix

Property	Object Type		
	Device	Binary Value	Analog Value
Object Identifier	×	×	×

### **10.3.9. BACnet Protocol Implementation Conformance Statement**

**Date:** 15th April, 2015  
**Vendor Name:** Invertek Drives Ltd  
**Product Name:** OPTIDRIVE ECO  
**Product Model Number:** ODV-3-xxxxxx-xxxx-xx  
**Application Software Version:** 2.00  
**Firmware Revision:** 2.00  
**BACnet Protocol Revision:** 7  
**Product Description:** Invertek Optidrive Eco

#### **BACnet Standardized Device Profile (Annex L):**

- BACnet Operator Workstation (B-OVS)
- BACnet Advanced Operator Workstation (B-AWS)
- BACnet Operator Display (B-OD)
- BACnet Building Controller (B-BC)
- BACnet Advanced Application Controller (B-AAC)
- BACnet Application Specific Controller (B-ASC)
- BACnet Smart Sensor (B-SS)
- BACnet Smart Actuator (B-SA)

#### **List all BACnet Interoperability Building Blocks Supported (Annex K):**

DS-RP-B, DS-WP-B, DM-DDB-B, DM-DOB-B, DM-DCC-B, DM-RD-B

#### **Segmentation Capability:**

- Able to transmit segmented messages Window Size
- Able to receive segmented messages Window Size

#### **Standard Object Types Supported:**

An object type is supported if it may be present in the device. For each standard Object Type supported provide the following data:  
1) Whether objects of this type are dynamically creatable using the CreateObject service  
2) Whether objects of this type are dynamically deletable using the DeleteObject service  
3) List of the optional properties supported  
4) List of all properties that are writable where not otherwise required by this standard  
5) List of all properties that are conditionally writable where not otherwise required by this standard  
6) List of proprietary properties and for each its property identifier, datatype, and meaning  
7) List of any property range restrictions

#### **Data Link Layer Options:**

- BACnet IP, (Annex J)
- BACnet IP, (Annex J), Foreign Device
- ISO 8802-3, Ethernet (Clause 7)
- ATA 878.1, 2.5 Mb. ARCNET (Clause 8)
- ATA 878.1, EIA-485 ARCNET (Clause 8), baud rate(s):
- MS/TP master (Clause 9), baud rate(s): 9600, 19200, 38400, 76800
- MS/TP slave (Clause 9), baud rate(s):
- Point-To-Point, EIA 232 (Clause 10), baud rate(s):
- Point-To-Point, modem, (Clause 10), baud rate(s):
- LonTalk, (Clause 11), medium:
- BACnet/ZigBee (ANNEX O)
- Other:

**Device Address Binding:**

Is static device binding supported? (This is currently necessary for two-way communication with MS/TP slaves and certain other devices.)

Yes  No

**Networking Options:**

- Router, Clause 6 - List all routing configurations, e.g., ARCNET-Ethernet, Ethernet-MS/TP, etc.
- Annex H, BACnet Tunnelling Router over IP
- BACnet/IP Broadcast Management Device (BBMD)

**Does the BBMD support registrations by Foreign Devices?**  Yes  No

**Does the BBMD support network address translation?**  Yes  No

**Network Security Options:**

- Non-secure Device - is capable of operating without BACnet Network Security
- Secure Device - is capable of using BACnet Network Security (NS-SD BIBB)
- Multiple Application-Specific Keys:
- Supports encryption (NS-ED BIBB)
- Key Server (NS-KS BIBB)

**Character Sets Supported:**

Indicating support for multiple character sets does not imply that they can all be supported simultaneously.

- |   |   |                                     |
|---|---|-------------------------------------|
| <input checked="" type="checkbox"/> ANSI X3.4 | <input type="checkbox"/> IBM™/Microsoft™ DBCS | <input type="checkbox"/> ISO 8859-1 |
| <input type="checkbox"/> ISO 10646 (UCS-2)    | <input type="checkbox"/> ISO 10646 (UCS-4)    | <input type="checkbox"/> JIS X 0208 |

If this product is a communication gateway, describe the types of non-BACnet equipment/networks(s) that the gateway supports.

# 11. Technical Data

## 11.1. Environmental

Ambient Temperature	Storage and Transportation Operating	All Units	-40 ... 60°C / -40 ... 140°F	
		IP20 Units	-10 ... 50°C / 14 ... 122°F	
		IP55 Units	-10 ... 40°C / 14 ... 104°F	UL Approved
			40 ... 50°C / 104 ... 122°F	With derating (refer to section 11.7.1. Derating for Ambient Temperature on page 84)
		IP66 Units	-10 ... 40°C / 14 ... 104°F	UL Approved
			40 ... 50°C / 104 ... 122°F	With derating (refer to section 11.7.1. Derating for Ambient Temperature on page 84)
Altitude	Operating	All Units	=<1000m	With UL approval
			=<4000m	With derating (refer to section 11.7.2. Derating for Altitude on page 84)
Relative Humidity	Operating	All Units	< 95%	Non-condensing, frost and moisture free
Environmental Conditions	IP55 & IP66 Optidrive Eco products are designed to operate in 3S3/3C3 environments in accordance with IEC 60721-3-3. IP20 Optidrive Eco products are designed to operate in 3S2/3C2 environments in accordance with IEC 60721-3-3.			

Refer to section 11.7. Derating Information on page 84 for derating information.

## 11.2. Phase Imbalance

All three phase Optidrive Eco units have phase imbalance monitoring. The maximum permissible voltage imbalance between any two phases is 3% for full load operation.

## 11.3. Input/Output Power and Current Ratings

The following tables provide the output current rating information for the various Optidrive Eco models. Invertek Drives always recommend that selection of the correct Optidrive is based upon the motor full load current at the incoming supply voltage.

Please note that the maximum cable length stated in the following tables indicate the maximum permissible cable length for the drive hardware and does not take into consideration EMC compliance.

### 11.3.1. IP20 200-240V 1 Phase Input, 3 Phase Output

Frame Size	Power Rating		Input Current	Fuse or MCB (Type B)		Maximum Cable Size		Rated Output Current	Maximum Motor Cable Length	
	kW	HP		Non UL	UL	mm <sup>2</sup>	AWG/kcmil		A	m
2	0.75	1	8.6	16	15	8	8	4.3	100	330
2	1.5	2	12.9	16	17.5	8	8	7	100	330
2	2.2	3	19.2	25	25	8	8	10.5	100	330

### 11.3.2. IP20 200-240V 3 Phase Input, 3 Phase Output

Frame Size	Power Rating		Input Current	Fuse or MCB (Type B)		Maximum Cable Size		Rated Output Current	Maximum Motor Cable Length	
	kW	HP		A	Non UL	UL	mm <sup>2</sup>		A	m
2	0.75	1	3.6	6	6	8	8	4.3	100	330
2	1.5	1.5	6.5	10	10	8	8	7	100	330

3	11	15	15.2	32	30	8	8	17	100	330
3	15	20	19.9	32	35	8	8	22	100	330
4	18.5	25	28.8	40	40	16	5	28	100	330
4	22	30	35.6	50	50	16	5	34	100	330
4	30	40	45.4	63	60	16	5	43	100	330

#### NOTE

- Ratings shown above apply to 40°C Ambient temperature (with the exception of the frame size 5 IP20 drives). For derating information, refer to section 11.7.1. Derating for Ambient Temperature on page 84.
- The drive is protected against short-circuit from power output to protective earth for all rated cable lengths, cable sizes and cable types.
- The maximum cable lengths stated here are based on hardware limitations and do NOT take into consideration any requirements for compliance to any EMC standards. Please see section 4.9. EMC Compliant Installation on page 30 for further information.
- The maximum motor cable length stated applies to using a shielded motor cable. When using an unshielded cable, the maximum cable length limit may be increased by 50%. When using the Invertek Drives recommended output choke, the maximum cable length may be increased by 100%.
- The PWM output switching from any inverter when used with a long motor cable length can cause an increase in the voltage at the motor terminals, depending on the motor cable length and inductance. The rise time and peak voltage can affect the service life of the motor. Invertek Drives recommend using an output choke for motor cable lengths of 50m or more to ensure good motor service life.
- For IP20 Frame Size 8 the Vector Speed and Torque control modes may not operate correctly with long motor cables and output filters. It is recommended to operate in V/F mode only for cable lengths exceeding 50m.
- Supply and motor cable sizes should be dimensioned according to local codes or regulations in the country or area of installation.
- For UL compliant installation, use Copper wire with a minimum insulation temperature rating of 70°C, UL Class CC or Class J Fuses (exception: Eaton Bussmann FWP series must be used for size 6A & 6B IP20 models).

### 11.4. Input Power Supply Requirements

Input Power Supply Requirements									
Supply Voltage	200 – 240 RMS Volts for 230 Volt rated units, + / - 10% variation allowed. 380 – 480 RMS Volts for 400 Volt rated units, + / - 10% variation allowed. 500 – 600 RMS Volts for 600 Volt rated units, + / - 10% variation allowed.								
Imbalance	Maximum 3% voltage variation between phase – phase voltages allowed. All Optidrive Eco units have phase imbalance monitoring. A phase imbalance of > 3% will result in the drive tripping.								
Frequency	50 – 60Hz + / - 5% Variation.								
Maximum Supply Short-Circuit Current Capacity	The maximum permissible short circuit current at the Optidrive Power terminals as defined in IEC60439-1 is: <table border="1" data-bbox="552 1799 949 1949"> <tr> <td>230V single phase input drives</td><td>5kA</td></tr> <tr> <td>230V three phase input drives</td><td>100kA</td></tr> <tr> <td>400V three phase input drives</td><td>100kA</td></tr> <tr> <td>600V three phase input drives</td><td>100kA</td></tr> </table>	230V single phase input drives	5kA	230V three phase input drives	100kA	400V three phase input drives	100kA	600V three phase input drives	100kA
230V single phase input drives	5kA								
230V three phase input drives	100kA								
400V three phase input drives	100kA								
600V three phase input drives	100kA								

## 11.5. Input Voltage Ranges

Depending upon model and power rating, the drives are designed for direct connection to the following supplies:

Model Number	Supply Voltage	Phases	Frequency
ODV-3-x2xxxx-1xxx-xx	200 – 240 Volts + / - 10%	1	50 – 60 Hz
ODV-3-x2xxxx-3xxx-xx	200 – 240 Volts + / - 10%	3	50 – 60 Hz
ODV-3-x4xxxx-3xxx-xx	380 – 480 Volts + / - 10%	3	50 – 60 Hz
ODV-3-x6xxxx-3xxx-xx	500 – 600 Volts + / - 10%	3	50 – 60 Hz

## 11.6. Additional Information for UL Compliance

Optidrive Eco is designed to meet the UL requirements. For an up to date list of UL compliant products, please refer to UL listing NMMS.E226333. In order to ensure full compliance, the following must be fully observed.

Input Power Supply Requirements	
Short Circuit Capacity	Please refer to section 11.4. <i>Input Power Supply Requirements</i> on page 82 for maximum supply short-circuit capacity limits. Limits apply as short-circuit Amperes symmetrical with the specified maximum supply voltage when protected by UL type J, or CC fuses (exception: Eaton Bussmann FWP series must be used for size 6A & 6B IP20 models).
Mechanical Installation Requirements	
Unless otherwise stated, all Optidrive Eco units are intended for indoor installation within controlled environments which meet the condition limits shown in section 11.1. <i>Environmental</i> on page 78.	
The drive can be operated within an ambient temperature range as stated in section 11.1. <i>Environmental</i> on page 78.	
Electrical Installation Requirements	
Incoming power supply connection must be according to section 4.3. <i>Incoming Power Connection</i> .	
Suitable Power and motor cables should be selected according to the data shown in section 11.3. <i>Input/Output Power and Current Ratings</i> and the National Electrical Code or other applicable local codes.	
Motor Cable	75°C Copper must be used.
Power cable connections and tightening torques are shown in sections 3.7. <i>Mounting the Drive – IP20 Units</i> , 3.9. <i>Guidelines for Mounting (IP55 Units)</i> and 3.10. <i>Guidelines for Mounting (IP66 Units)</i> .	
Integral Solid State short circuit protection does not provide branch circuit protection. Branch circuit protection must be provided in accordance with the National Electrical Code and any additional local codes. Ratings are shown in section 11.3. <i>Input/Output Power and Current Ratings</i> .	
UL Listed ring terminals / lugs must be used for all bus bar and grounding connections.	
General Requirements	
Optidrive Eco provides motor overload protection in accordance with the National Electrical Code (US).	
<ul style="list-style-type: none"> <li>▪ Where a motor thermistor is not fitted, or not utilised, Thermal Overload Memory Retention must be enabled by setting P4-12 = 1.</li> <li>▪ Where a motor thermistor is fitted and connected to the drive, connection must be carried out according to the information shown in section 4.8. <i>Motor Thermal Overload Protection</i>.</li> </ul>	
For Canadian Installations:	
Transient surge suppression shall be installed on the line side of this equipment and shall be rated as shown below, suitable for over voltage category III and shall provide protection for a rated impulse withstand voltage peak of 2.5kV.	
<b>Supply Voltage Rating of the Drive</b>	
<b>Phase-Phase Surge Protection Voltage Rating</b>	
200 - 240VAC + / - 10%	
230VAC	
380 - 480VAC + / - 10%	
480VAC	
500 - 600VAC + / - 10%	
600VAC	
<b>Phase-Ground Surge Protection Voltage Rating</b>	
230VAC	
480VAC	
600VAC	

## 11.7. Derating Information

Derating of the drive maximum continuous output current capacity is required when:

- Operating at ambient temperature in excess of 40°C / 104°F (IP55 & IP66) or 50°C / 122°F (IP20).
- Operating at Altitude in excess of 1000m / 3281 ft.
- Operation with Effective Switching Frequency higher than default.

The following derating factors should be applied when operating drives outside of these conditions.

### 11.7.1. Derating for Ambient Temperature

Enclosure Type	Maximum Temperature Without Derating	Derate by	Maximum Permissible
IP20	50°C / 122°F	N/A	50°C / 122°F
IP20 Frame Size 5	35°C / 95°F	1.1% per °C (1.8°F)	50°C / 122°F
IP55	40°C / 104°F	1.5% per °C (1.8°F)	50°C / 122°F
IP66	40°C / 104°F	2.5% per °C (1.8°F)	50°C / 122°F

### 11.7.2. Derating for Altitude

Enclosure Type	Maximum Temperature Without Derating	Derate by	Maximum Permissible
IP20	1000m / 3281ft	1% per 100m / 328 ft	4000m / 13123 ft
IP55	1000m / 3281ft	1% per 100m / 328 ft	4000m / 13123 ft
IP66	1000m / 3281ft	1% per 100m / 328 ft	4000m / 13123 ft

### 11.7.3. Derating for Switching Frequency

Enclosure Type	Switching Frequency (Where available)										
	Frame Size	4kHz	8kHz	10kHz	12kHz	14kHz	16kHz	18kHz	20kHz	24kHz	32kHz
IP66	2	N/A	N/A	0%	0%	0%	0%	0%	0%	N/A	N/A
	3	N/A	N/A	0%	0%	0%	6%	N/A	N/A	N/A	N/A
IP55	4	N/A	N/A	0%	0%	12%	23%	33%	41%	N/A	N/A
	5	N/A	N/A	0%	0%	11%	23%	36%	42%	N/A	N/A
	6	0%	16%	N/A	28%	N/A	39%	N/A	N/A	N/A	N/A
	7	0%	12%	N/A							
IP20	2	N/A	N/A	0%	14%	23%	32%	37%	43%	N/A	N/A
	3	N/A	N/A	0%	2%	13%	19%	25%	35%	N/A	N/A
	4	N/A	N/A	0%	15%	13%	39%	52%	62%	N/A	N/A
	5	N/A	N/A	0%	3%	9%	14%	19%	24%	N/A	N/A
	6	0%	N/A	N/A	N/A	N/A	N/A	N/A	N/A	N/A	N/A
	8	0%	N/A	N/A	N/A	N/A	N/A	N/A	N/A	N/A	N/A

### 11.7.4. Example of Applying Derating Factors

A 4kW, IP66 drive is to be used at an altitude of 2000 metres above sea level, with 16 kHz switching frequency and 45°C ambient temperature.

From the table above, we can see that the rated current of the drive is 9.5 Amps at 40°C,

Firstly, apply the switching frequency derating (if any), 16 kHz, 0% derating.

Now, apply the derating for higher ambient temperature,  $2.5\% \text{ per } ^\circ\text{C}$  above  $40^\circ\text{C} = 5 \times 2.5\% = 12.5\%$

$9.5 \text{ Amps} \times 87.5\% = 8.3 \text{ Amps}$ .

Now apply the derating for altitude above 1000 metres,  $1\% \text{ per } 100\text{m}$  above  $1000\text{m} = 10 \times 1\% = 10\%$

$8.3 \text{ Amps} \times 90\% = 7.5 \text{ Amps}$  continuous current available.

If the required motor current exceeds this level, it will be necessary to either:

- Reduce the switching frequency selected; or
- Use a higher power rated drive and repeat the calculation to ensure sufficient output current is available.

## 11.8. Internal EMC Filter and Varistors – Disconnection Procedure

### 11.8.1. IP20 Drive Models

All Optidrive Eco models provide a simple method to disconnect the internal EMC filter and surge protection varistors by fully removing the screws shown below. This should only be carried out where necessary, for example in cases such as IT or ungrounded supplies, where the phase to ground voltage can exceed the phase to phase voltage.

The EMC filter disconnect screw is labelled "EMC".

The surge protection varistors disconnect screw is clearly labelled "VAR".

#### Frame Sizes 2 & 3

The EMC Filter and Varistor disconnect screws are located on the left side of the product when viewed from the front. Remove both screws completely.

#### Frame Size 5

Frame Size 5 units have EMC Filter disconnection points only located on the front face of the unit as shown.

#### Frame Size 4

Frame Size 4 units have EMC Filter disconnection points only located on the front face of the unit as shown.

#### Frame Size 6A/6B

Frame Size 6A/6B units have EMC Filter disconnection points behind the front cover of the unit as shown.

### 11.8.2. IP66 Outdoor Rated Models

Remove the terminal cover as illustrated in 3.13.5. IP66 Frame Sizes 2 & 3 and 3.13.6. IP66 Frame Size 4 on page 22 and then disconnect the EMC filter as shown in the illustration opposite.

### 11.8.3. IP55 Models

These models require disassembly in order to disconnect the EMC filter. Disconnection should be carried out only by Invertek Drives Approved Service Partners.

# 12. Troubleshooting

## 12.1. Fault Messages

Fault Code	No.	Message	Description	Corrective Action
no-Flt	00	No Fault	No Fault	Displayed in P0-13 if no faults are recorded in the log.
O-i	03	Over current trip	Instantaneous over current on drive output	<p><b>Fault Occurs on Drive Enable</b>            Check the motor and motor connection cable for phase – phase and phase – earth short circuits.            Check the load mechanically for a jam, blockage or stalled condition.            Ensure the motor nameplate parameters are correctly entered, P1-07, P1-08, P1-09.            Reduced the Boost voltage setting in P1-11.            Increase the ramp up time in P1-03.            If the connected motor has a holding brake, ensure the brake is correctly connected and controlled, and is releasing correctly.</p> <p><b>Fault Occurs When Running</b>            Reduce the speed loop gain in P4-03 and P4-04.</p>
I-Et-ErP	04	Over load trip	Drive has tripped on overload after delivering >100% of value in P1-08 for a period of time	Check to see when the decimal points are flashing (drive in overload) and either increase acceleration rate or reduce the load. Check motor cable length is within the limit specified for the relevant drive in section 11.3. Input/Output Power and Current Ratings. Ensure the motor nameplate parameters are correctly entered in P1-07, P1-08, and P1-09. Check the load mechanically to ensure it is free, and that no jams, blockages or other mechanical faults exist. For a centrifugal fan or pump, a small reduction in output frequency could significantly reduce the load.
P5-EtP	05	Hardware Over Current	Instantaneous over current on drive output	Check the motor wiring and motor itself for phase to phase and phase to earth short circuits. Disconnect the motor and motor cable and retest. If the drive trips with no motor connected, it must be replaced and the system fully checked and retested before a replacement unit is installed.
O-voltE	06	Over voltage	Over voltage on DC bus	The value of the DC Bus Voltage can be displayed in P0-20. A historical log is stored at 250ms intervals prior to a trip in parameter P0-36. This fault is generally caused by excessive regenerative energy being transferred from the load back to the drive. When a high inertia or over hauling type load is connected. If the fault occurs on stopping or during deceleration, increase the deceleration ramp time P1-04. If operating in PID control, ensure that ramps are active by reducing P3-11.
U-voltE	07	Under voltage	Under voltage on DC bus	This occurs routinely when power is switched off. If it occurs during running, check the incoming supply voltage, and all connections into the drive, fuses, contactors etc.
O-t	08	Over temperature trip	Heatsink over temperature	The heatsink temperature can be displayed in P0-21. A historical log is stored at 30 second intervals prior to a trip in P0-38. Check the drive ambient temperature. Ensure the drive internal cooling fan is operating. Ensure that the required space around the drive as shown in section 3.7 Mounting the Drive – IP20 Units, 3.9. Guidelines for Mounting (IP55 Units) and 3.10. Guidelines for Mounting (IP66 Units) has been observed, and that the cooling airflow path to and from the drive is not restricted. Reduce the effective switching frequency setting in parameter P2-24. Reduce the load on the motor / drive.
U-t	09	Under temperature trip	Drive Under temperature	Trip occurs when ambient temperature is less than -10°C. The temperature must be raised over -10°C in order to start the drive.
P-dEF	10	Load default parameters	Factory Default parameters have been loaded	Press STOP key, the drive is now ready to be configured for the required application. Four button defaults – see section 5.4. Changing Parameters.
E-Et-EP	11	External trip	Digital Input External trip	E-trip requested on control input terminals. Some settings of P1-13 require a normally closed contact to provide an external means of tripping the drive in the event that an external device develops a fault. If a motor thermistor is connected check if the motor is too hot.
SC-0b5	12	Optibus serial comms fault	Communications Fault	Communications lost with PC or remote keypad. Check the cables and connections to external devices.

Fault Code	No.	Message	Description	Corrective Action
F <sub>L</sub> E-dc	13	Excessive DC ripple	Excessive DC Ripple on Internal DC bus	The DC Bus Ripple Voltage level can be displayed in parameter P0-16. A historical log is stored at 20ms intervals prior to a trip in parameter P0-37. Check all three supply phases are present and within the 3% supply voltage level imbalance tolerance. Reduce the motor load. If the fault persists, contact your local Invertek Drives Sales Partner.
P-L <sub>O</sub> S5	14	Input phase loss	Input phase missing trip	Drive intended for use with a 3 phase supply, one input phase has been disconnected or lost.
H-O-I	15	Hardware detected Instant over current	Instantaneous over current on drive output	Refer to fault 3 above.
E <sub>H</sub> -F <sub>L</sub> E	16	Thermistor Fault	Faulty thermistor on heat-sink	Refer to your Invertek Sales Partner.
dR <sub>E</sub> R-F	17	I/O processor data error	Internal memory fault	Parameters not saved, defaults reloaded. If problem reoccurs, refer to your IDL Authorised Distributor.
4-20F	18	4-20mA signal out of range	4-20mA Signal Lost	The reference signal on Analog Input 1 or 2 (Terminals 6 or 10) has dropped below the minimum threshold of 3mA when signal format is set to 4-20mA. Check the signal source and wiring to the Optidrive terminals.
dR <sub>E</sub> R-E	19	M/C processor data error	Internal memory fault	Parameters not saved, factory defaults are reloaded. If problem reoccurs, refer to your IDL Authorised Distributor.
U-dE <sub>F</sub>	20	User Parameter Default	User Parameter Defaults	User Parameter default has been loaded. Press the Stop key. Three button default – see section 5.5. Parameter Factory Reset / User Reset.
F-P <sub>E</sub> c	21	Motor PTC over heat	Motor PTC Over Temperature	The connected motor PTC device has caused the drive to trip (analog input 2 configured for PTC device).
F <sub>R</sub> n-F	22	Cooling Fan Fault	Cooling Fan Fault	Check and if necessary, replace the drive internal cooling fan.
D-hE <sub>A</sub> t	23	Ambient Temperature High	Ambient Temperature too High	Ensure the drive internal cooling fan is operating. Ensure that the required space around the drive as shown in sections 3.7 Mounting the Drive – IP20 Units, 3.9. Guidelines for Mounting (IP55 Units) and 3.10. Guidelines for Mounting (IP66 Units) has been observed, and that the cooling airflow path to and from the drive is not restricted. Increase the cooling airflow to the drive. Reduce the effective switching frequency setting in parameter P2-24. Reduce the load on the motor / drive.
D- <sub>E</sub> or9	24	High motor current	Motor current above configured profile	Current Monitoring Function has detected motor current levels above the normal operating condition for the application. Check mechanical load has not changed and that the load is not jammed or stalling. For pump application check for potential pump blockage. For fan applications check airstream to and from the fan is not restricted.
U- <sub>E</sub> or9	25	Low motor current	Motor current below configured profile	Current Monitoring Function has detected motor current levels below the normal operating condition for the application. Check for mechanical breakages causing loss of load (e.g. belt break). Check motor has not become disconnected from the drive.
D <sub>U</sub> E-F	26	Drive Output Fault	Drive output fault	Drive output fault. Check for loose motor cables at the drive and at the motor or any termination in between. Otherwise refer to your IDL Authorised Distributor.
S <sub>to</sub> -F	29	Internal STO circuit Error	Refer to your Invertek Sales Partner	If the drive identifies a potential fault in the internal STO circuit, the drive will return a Sto-F trip. This could be caused by a slow ramping 24V signal being applied to the STO circuit. This trip can only be re-set by cycling the power to the drive.  This trip can also be generated if the Sto-F trip is enabled by setting P6-16=1 (enable) and the STO is opened when the drive is running. If the STO is opened when the drive is not running, the drive will enter the INHIBIT state. If the trip is generated in this way, it can be re-set as with any other trips. This mode is disabled by default (P6-16 = 0).

Fault Code	No.	Message	Description	Corrective Action
REF-01	40	Autotune fail 1	Autotune Failed	Measured motor stator resistance varies between phases. Ensure the motor is correctly connected and free from faults. Check the windings for correct resistance and balance.
REF-02	41	Autotune fail 2		Measured motor stator resistance is too large. Ensure the motor is correctly connected and free from faults. Check that the power rating corresponds to the power rating of the connected drive.
REF-03	42	Autotune fail 3		Measured motor inductance is too low. Ensure the motor is correctly connected and free from faults.
REF-04	43	Autotune fail 4		Measured motor inductance is too large. Ensure the motor is correctly connected and free from faults. Check that the power rating corresponds to the power rating of the connected drive.
REF-05	44	Autotune fail 5		Measured motor parameters are not convergent. Ensure the motor is correctly connected and free from faults. Check that the power rating corresponds to the power rating of the connected drive.
Ph-SE9	45	Incorrect Supply Phase Sequence	L1-L2-L3 Phase sequence is incorrect	Applies to Frame Size 8 drives only, indicates that the incoming power supply phase sequence is incorrect. Any 2 phases may be swapped.
Pr-Lo	48	Feedback Pressure Low	Low Pressure Detected by Pipe Fill Function	Check the pump system for leaks or burst pipes. Check the Pipe fill function has been commissioned correctly (P3-16 & P3-17).
Out-Ph	49	Output Phase Loss	Output (Motor) Phase Loss	One of the motor output phases is not connected to the drive.
Sc-F01	50	Modbus Comms fault	Built-in Modbus RTU communication timeout or Communication Option Module Fault	<b>When using Modbus RTU:</b> Valid Modbus telegram has not been received within the watchdog time limit set in P5-05. Check the network master / PLC is still operating. Check the connection cables. Increase the value of P5-05 to a suitable level. <b>When using an optional fieldbus Interface:</b> Internal communication to the inserted Communication Option Module has been lost. Check the module is correctly inserted.
Sc-F03	52	Plug-in communication option module timeout	Fitted communication Module Fault	A telegram containing a valid Control Word from the network master has not been received within the watchdog time limit set in P5-05. Check the network master / PLC is still operating. Check the connection cables. Increase the value of P5-05 to a suitable level.
Sc-F04	53	IO Card Comms fault	IO card comms trip	Internal communication to the inserted I/O Option Module has been lost. Check the module is correctly inserted.
Sc-F05	54	BACnet Comms fault	BACnet comms loss trip	A valid BACnet telegram has not been received within the watchdog time limit set in P5-05. Check the network master / PLC is still operating. Check the connection cables. Increase the value of P5-05 to a suitable level.

## 12.2. Resetting a Fault

When the drive trips, and a fault message is displayed, it can be reset in one of the following ways:

- Completely remove the incoming power supply, and allow the power to power off completely. Re-apply the power.
- Remove and reapply the enable input.
- Press the stop / Reset button.
- If Fieldbus is being used, set the reset bit in the control word from 0 to 1.

In the event of O-l, hO-l or l.t-trp faults, in order to prevent damage that may occur through repeatedly enabling the drive into a fault condition, these trips cannot be reset immediately. A delay time according to the following table must be allowed before reset is possible.

First Trip	2 seconds delay before reset is possible
Second Trip	4 seconds delay before reset is possible
Third Trip	8 seconds delay before reset is possible
Fourth Trip	16 seconds delay before reset is possible
Fifth Trip	32 seconds delay before reset is possible
Subsequent Trips	64 seconds delay before reset is possible
